

# GlueX Two Magnet Tagger

G. Yang      University of Glasgow

Part 1, 3 D Tosca analysis.

Part 2, Preliminary Drawings.

Part 3, Proposed Assembly Procedures

(i) Complete Tagger.

(ii) Vacuum Chamber Tests.

## Part 1 3 D Tosca analysis

Software used : Opera 3D, version 8.010.

What we have calculated:

- 2 D, 3 D magnetic field distributions.
- The Effective field boundary along the magnet edge.
- Electron trajectories calculated by using Opera 3D, post processor.
- Optical properties using a grouping of 9 electrons trajectories.

2 D magnetic field histogram calculated by TOSCA.

magnetic field along a line perpendicular to the magnet output edge.

- Electron trajectories have been calculated using Opera 3 D post processor.
- By using the calculated electron trajectories, beam spot size, and focal plane position have been determined.

## Calculated electron trajectories

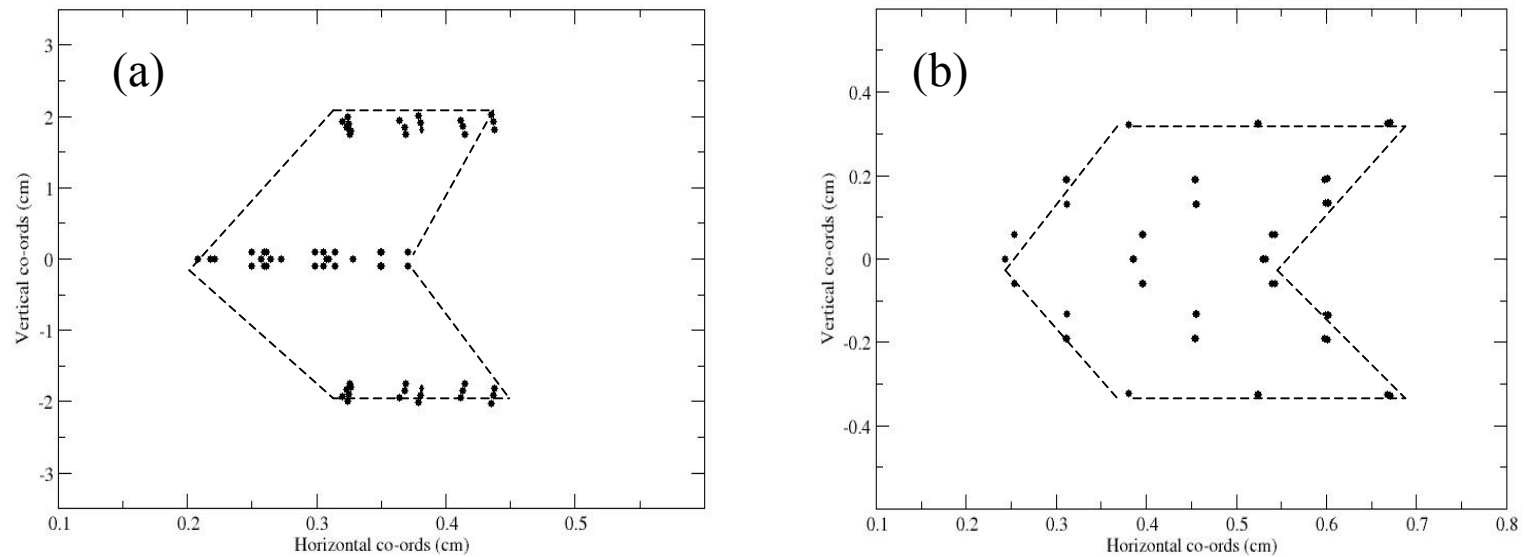

Electron trajectory bundles according to their directions at the object position.

Beam trajectories calculated from TOSCA in the mid plane for 1 GeV and 9 GeV. Those trajectories having the same direction focus on position 1, and those trajectories having the same starting position focus on position 2. ( electrons travelling in the direction shown by the top arrow ).

## Other interesting results

The intersections of the beam trajectories with the plane through the focusing point and perpendicular to the beam ((a): 1 GeV, (b): 9 GeV), the dotted lines show the beam spot profile.

(We have used a rectangular object shape. So, ideally we expect to obtain a rectangular image at the focal plane.)

## Part 2 Preliminary drawings

- Preliminary drawings of the two identical magnet tagger system are shown. The magnet dimension used here are the same as used in the Tosca analysis.
- The drawings include the two magnets, a vacuum chamber.
- Assembly procedure are proposed.

## The two identical magnets tagger

The electron entrance angle :5.9 degrees

Main beam exit angle: 6.6 degrees

Main beam bending angle 13.4 degrees

The angle between the photon exit beam and the focal plane: 9.94 degrees

## Vertical section through one of the dipole magnets showing pole profile and coil geometry

- Length: 3.11 m.
- Width: 1.09 m.
- Height: 1.41 m.
- Weight: ~38 Tonns for one magnet.
- Conductor area: 84 cm<sup>2</sup>.
- Current: 154 A.
- Magnetic field: 1.5 T.
- Pole gap: 2 cm

# Vacuum chamber

Section BB' ( $\times 8$ )

Section AA' ( $\times 8$ )

Vertical section showing how vacuum  
O-ring compression is determined

Vertical section showing how coils are supported against magnetic forces (0.5 ton)

Vertical section showing how weight of coils are supported (each coil ~0.4 ton)

## The brackets and spacers used in the tagger system

1

2

3

4

### Part 3. (i) Proposed Assembly procedure for complete tagger

### Part 3. (ii) Proposed Assembly procedure for vacuum chamber testing

## Conclusions

1. Optical properties meet design specification
2. Sufficient details is provided so that a realistic cost estimate of the tagger magnets and vacuum chamber can be obtained from potential manufactures.
