

# **Hall-D Software Status**

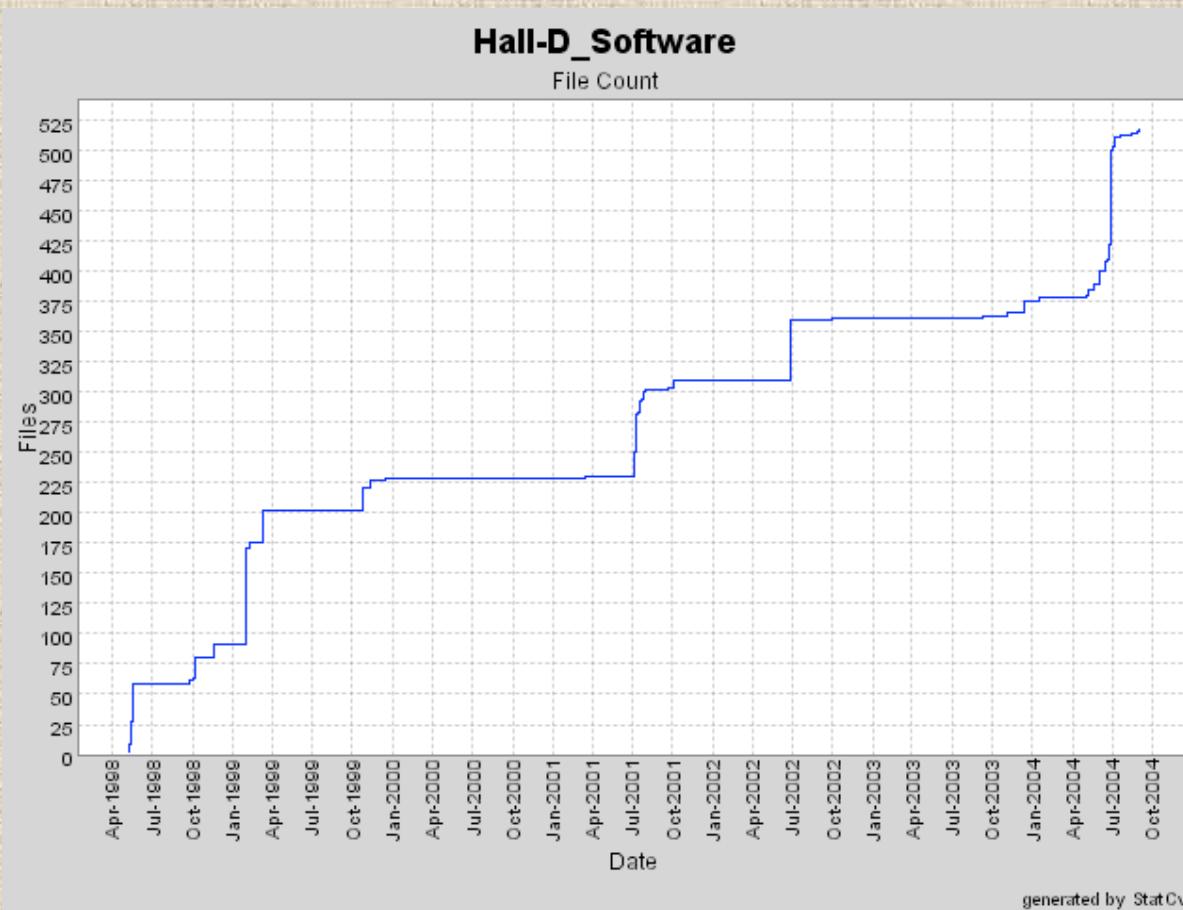

September 10, 2004

D. Lawrence JLab

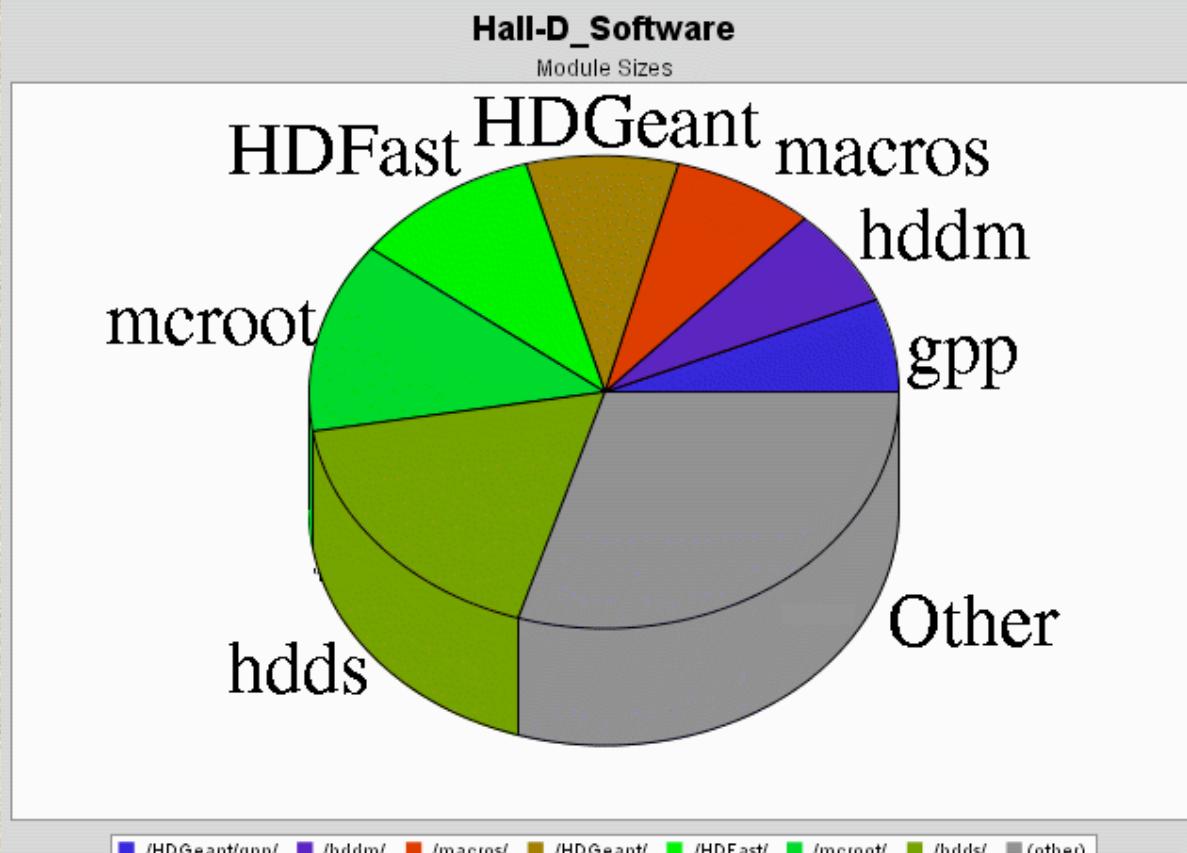

# History of Code Development

# History of Code Development

# History of Code Development

# Weekly Software Meetings

- Meetings almost every week since May 5th(~17 meetings)
- Discussions of policy, philosophy and design specifics of Hall-D software
- Anyone is welcome to connect to the meeting via VRVS or telephone.  
Meeting announcements sent out to  
[halld-computing@jlab.org](mailto:halld-computing@jlab.org)

# Software Topics Discussed

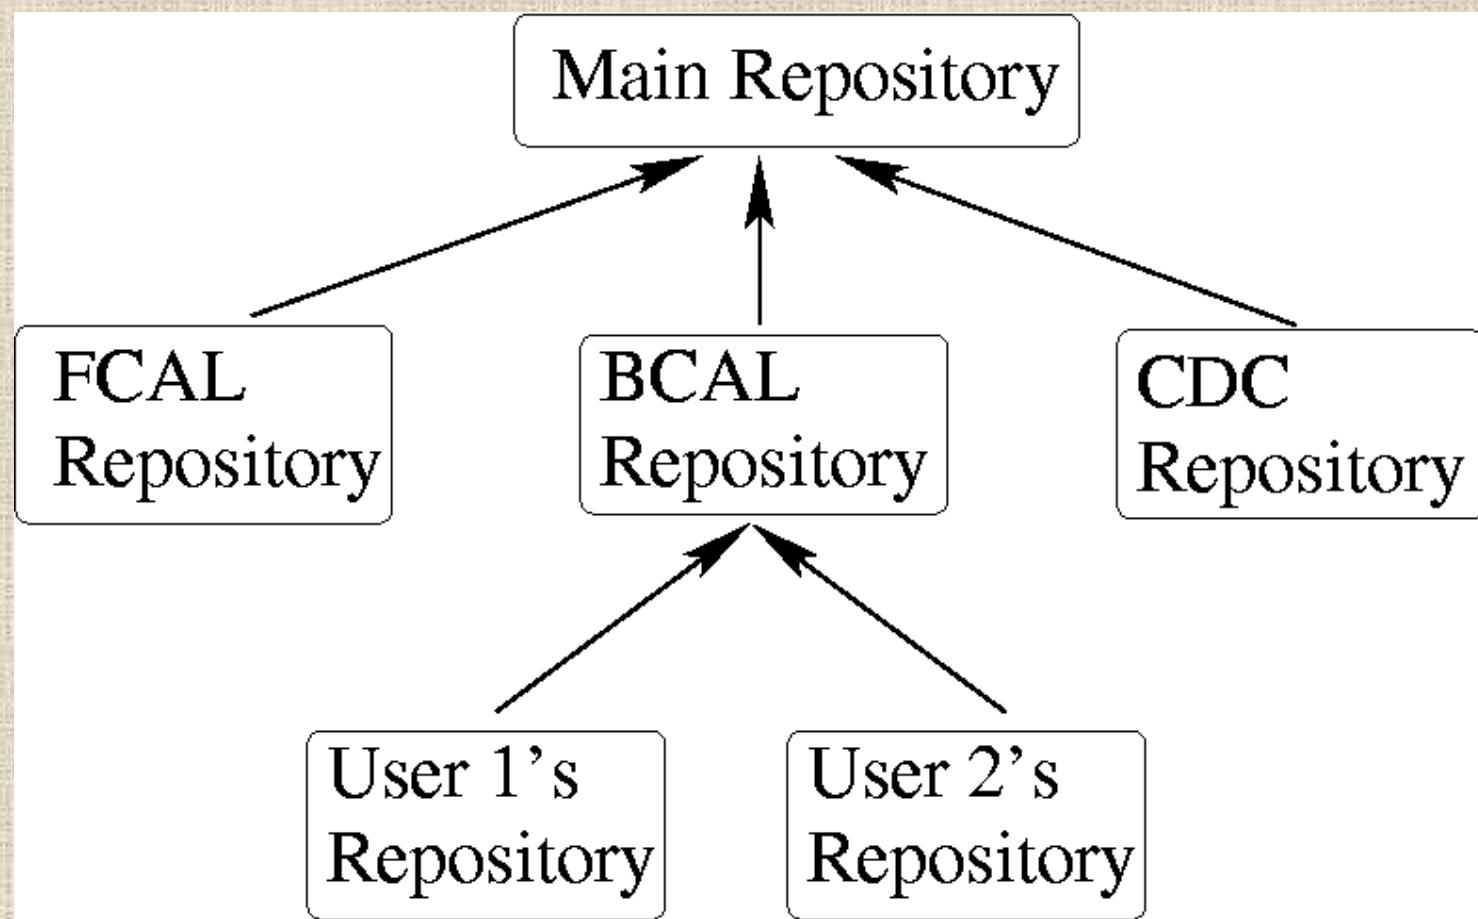

- Data Model (HDDM)
- PID/Gas Cherenkov detector GEANT studies
- GlueX Portal
- Analysis Framework
- Version Control: CVS vs. BitKeeper
- Make system
- Tagger simulation
- Code documentation

# Version Control

BitKeeper will be tested first on  
**hdds** package *after* detector  
review

See Hall-D note “Why BitKeeper” GlueX-doc-183-v1

# GateKeeper Model

# Redefining Forum Topics

## Software Related Forums

- HDFast
- HDGeant
- HDDS Geometry Package
- Standards and Porting Issues
- HDDM Data Model Package
- PWA

# Use Doxygen to generate code documentation

Example

# Use ROOT for 3-vector and 4-vector classes

- TVector3, TLorentzVector are based (partly) on CLHEP classes
- Some methods:
  - Boost(bx,by,bz)
  - RotateX(radians)
  - M(),M2()
  - SetPhi(),SetTheta()

```
TRotation R;  
TLorentzVector d, dprime, a;  
  
dprime = a + d*R;
```

# In-memory data structures defined in XML schemas

```
<xs:element name="fdcPoint">
  <xs:complexType>
    <xs:attribute name="dEdx" type="hddm:float" use="required"/>
    <xs:attribute name="dradius" type="hddm:float" use="required"/>
    <xs:attribute name="track" type="hddm:int" use="required"/>
    <xs:attribute name="x" type="hddm:float" use="required"/>
    <xs:attribute name="y" type="hddm:float" use="required"/>
    <xs:attribute name="z" type="hddm:float" use="required"/>
  </xs:complexType>
</xs:element>
```

# **So Where Are We?**

# HDFast

- Provides parametric simulation of entire Hall-D detector
- Provides full tracking results with smearing based on individual detector resolutions
- Numerous tools for looking at data
- Runs on RH Enterprise Linux

# HDFast

**Hall D Meson Spectrometer Stage 1**

The diagram illustrates the Hall D Meson Spectrometer Stage 1. It shows two views of the detector stack. The top view shows a yellow solenoid, a pink BCAL, a red CDC, a blue VTX, and a cyan FDC. The bottom view shows a yellow solenoid, a pink BCAL, a red CDC, a blue VTX, and a cyan FDC. A green trajectory line passes through the CDC and BCAL layers. A red trajectory line passes through the VTX and BCAL layers. A blue trajectory line passes through the FDC and BCAL layers. A grey circle labeled "solenoid" is shown below the detectors. A coordinate system with axes x, y, and z is shown.

Get Event

# **HDGeant**

- Fully detailed physics simulation using Geant3
- Useful for background studies
- Provides data which can be used to develop reconstruction packages

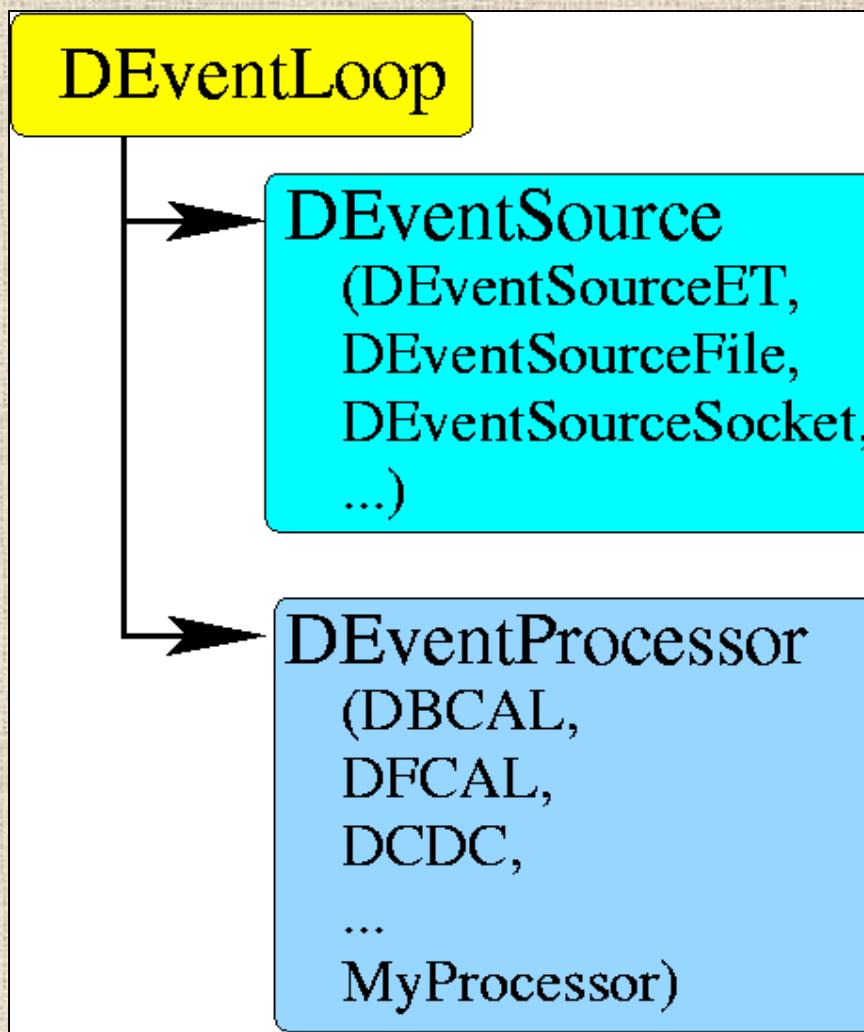

# HDGeant

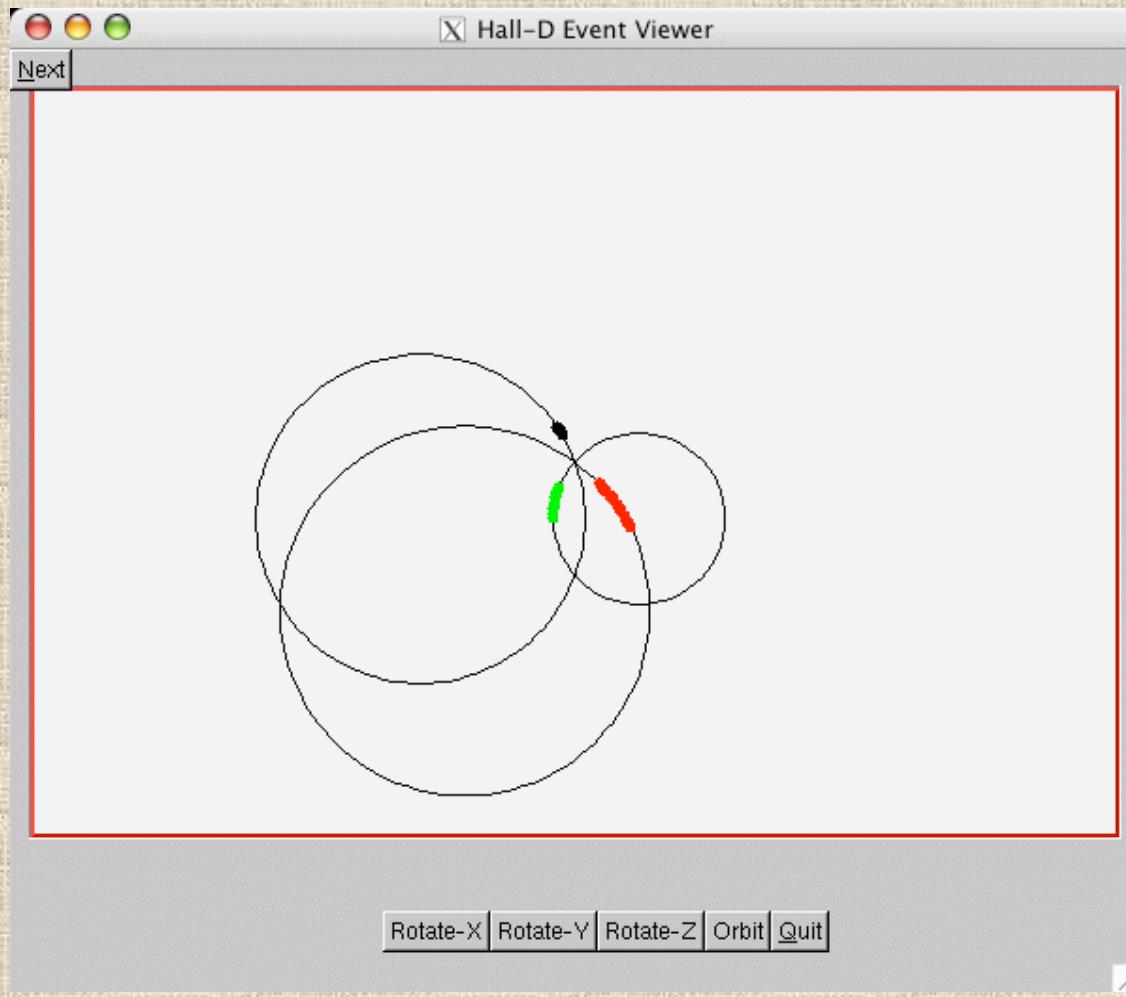

# HDDM : Data Model

- Data structures defined using XML schemas
- C code generated from schemas
- Platform independent I/O routines generated from schemas

# DANA : Hall-D Analysis Framework

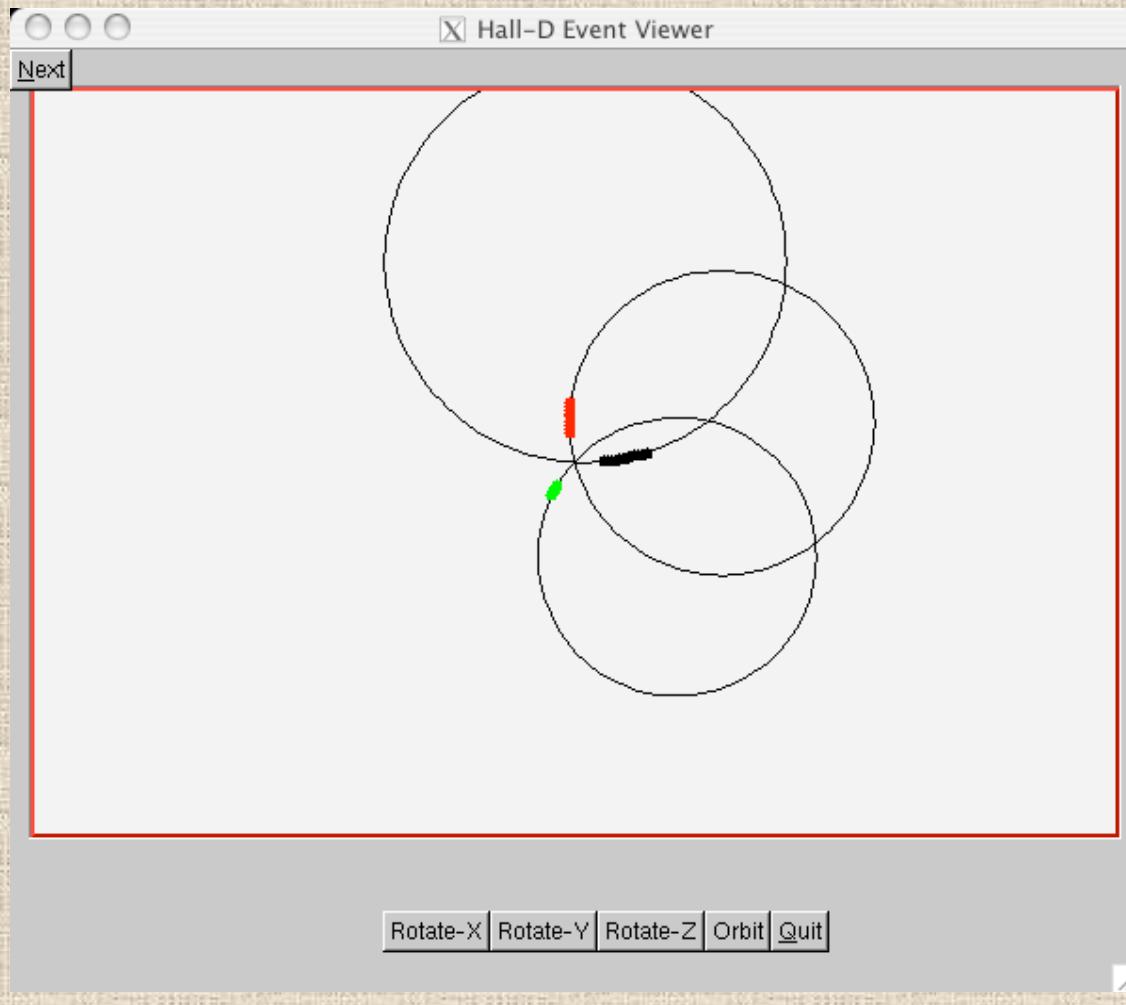

# CDC “First Guess”

# CDC “First Guess”

# CDC “First Guess”

# Looking Ahead

- Adopt coding guidelines, establish gatekeepers, identify validation tests
- Continue with Analysis Framework
- Reconstruction (tracking, cluster finding, ...)
- Calibration/Parameters Database
- GEANT4
