

# PrimEx Pi0 Update

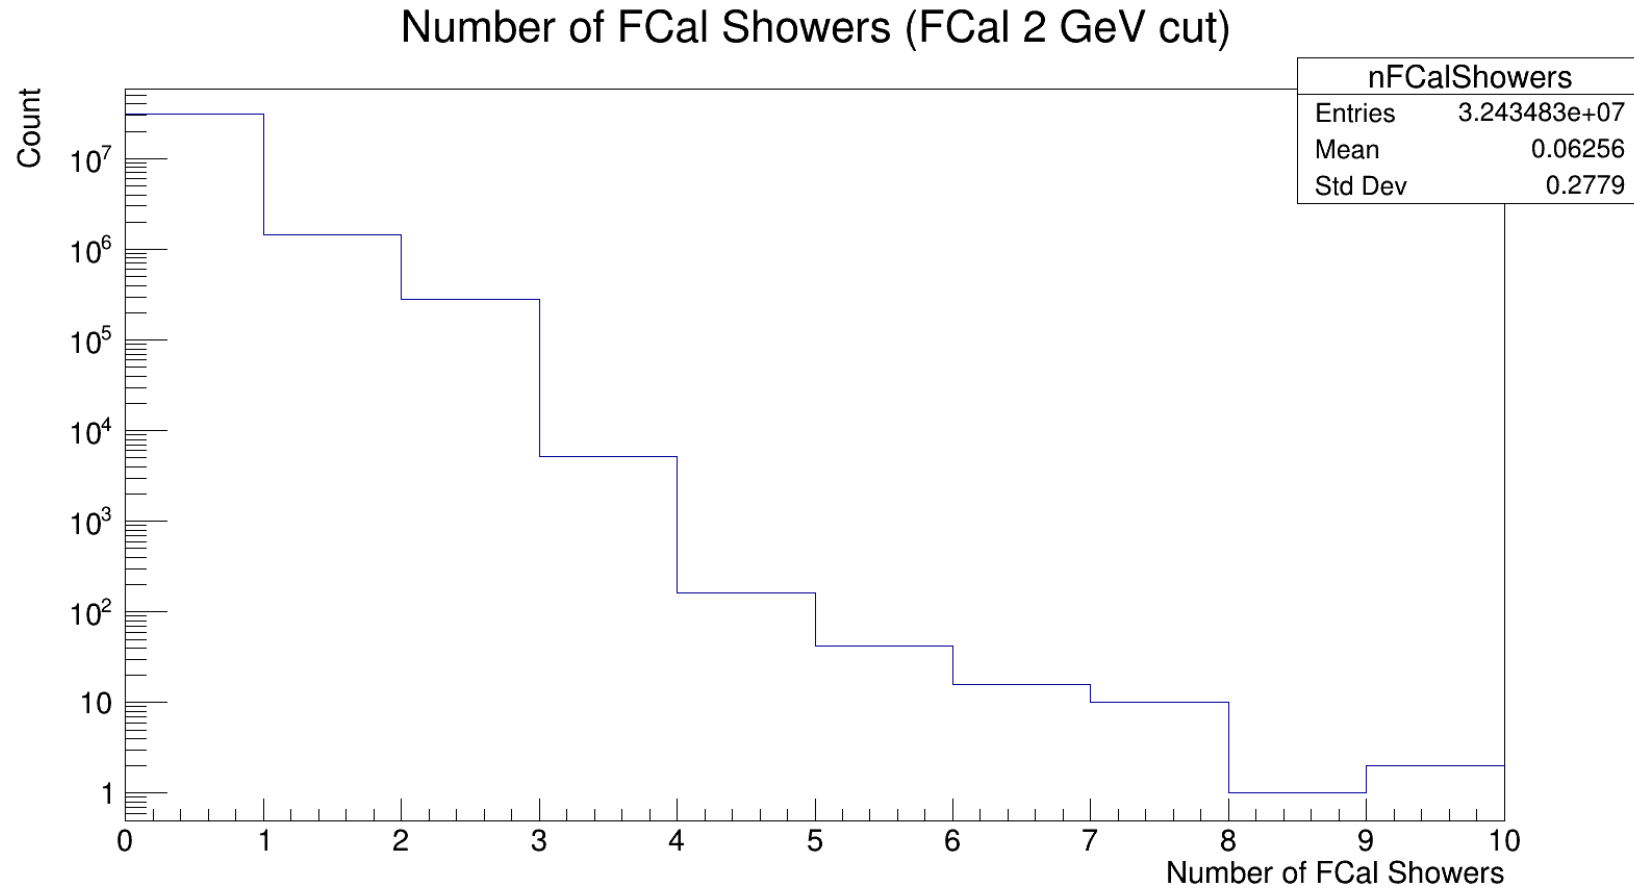

Tyler Hague

July 10

# Cut Definitions

- 2 Gamma – Two showers in FCal with an energy greater than 2 GeV
- Loose Pi0 –  $0.11 \leq \text{Invariant Mass (GeV)} \leq 0.16$
- ToF Veto – No corresponding Time-of-Flight detector hit
- FCal Timing – FCal showers must occur within 4ns of each other
- Energy Conservation –  $\text{Abs}(\text{Beam Energy} - \text{Meson Energy}) < 1.5 \text{ GeV}$
- Accidental Subtraction -

# Number of FCal Showers

# FCal Shower Energy

Energy of FCal Showers (FCal 0.5 GeV cut)

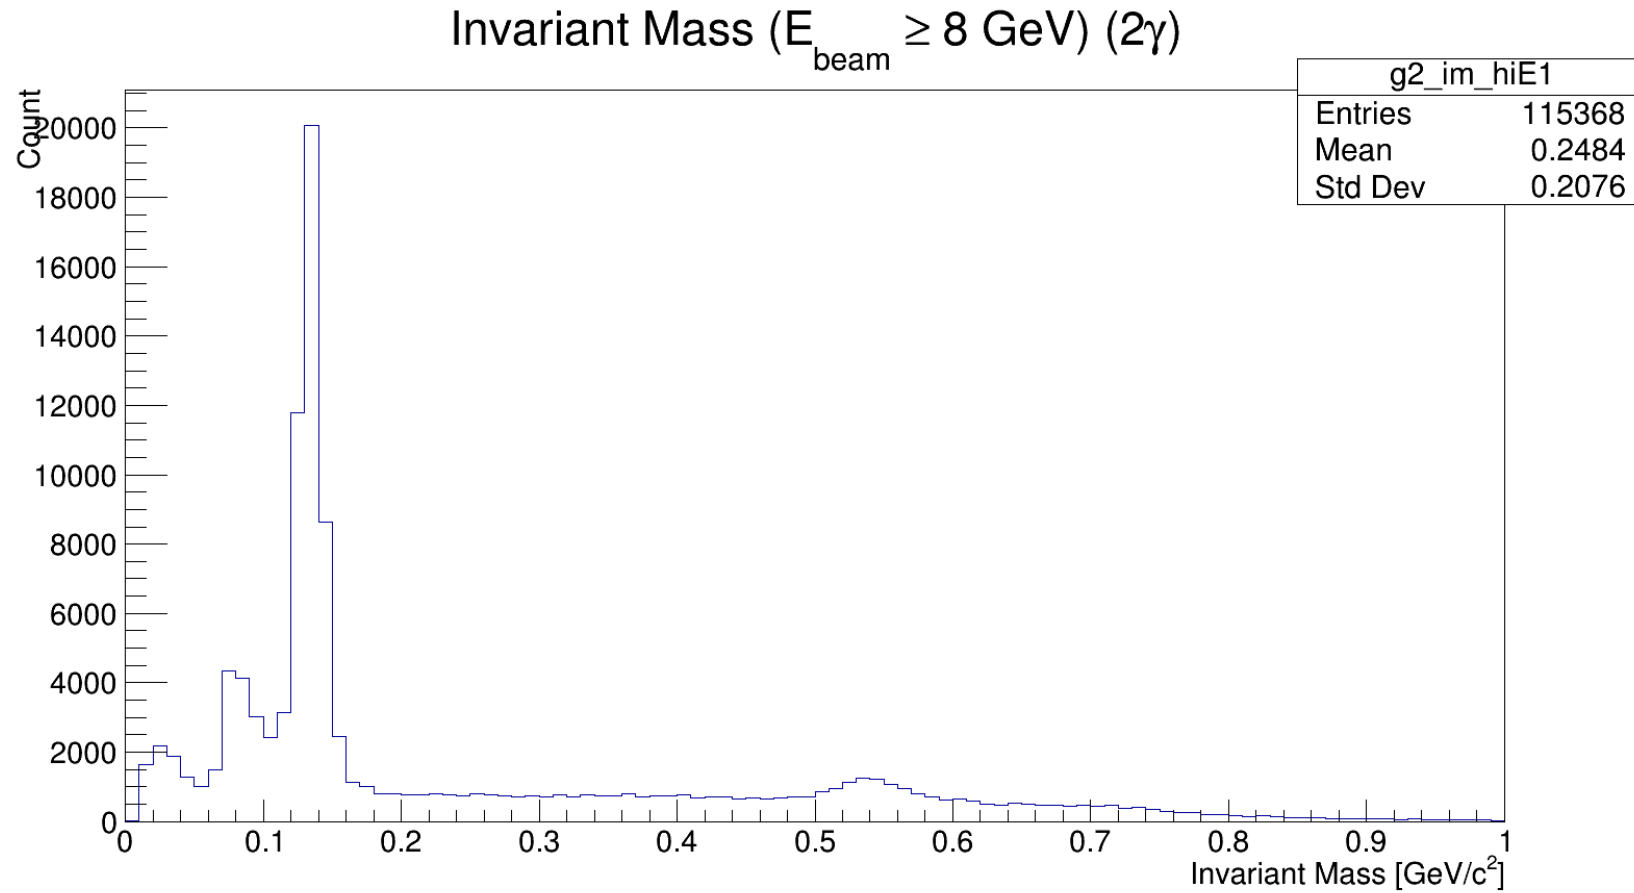

# FCal Shower Energy

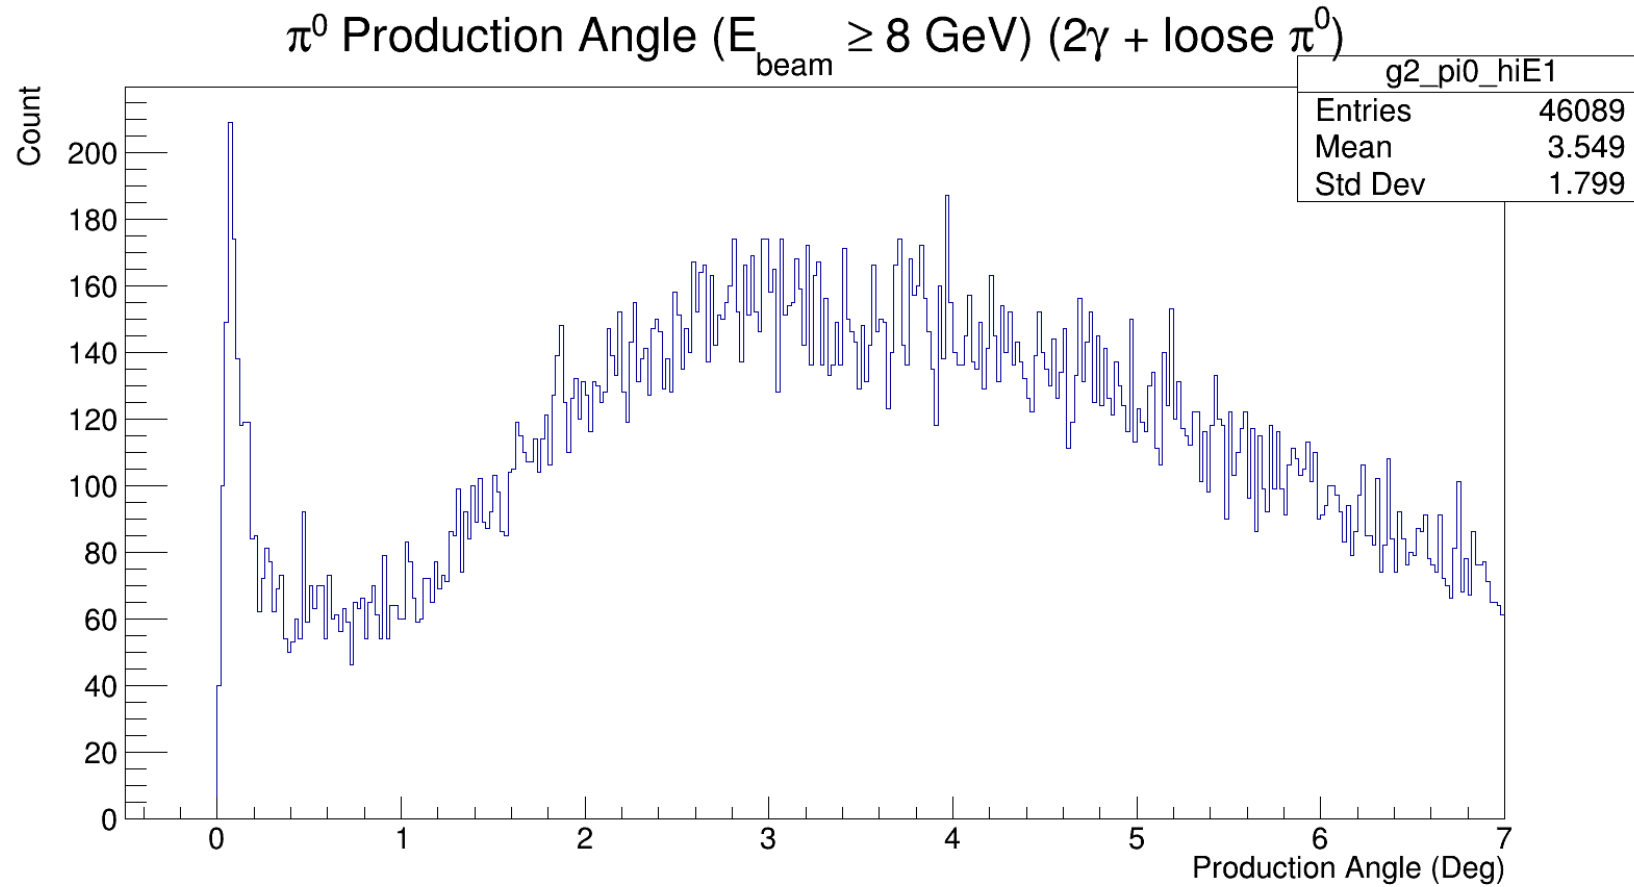

Energy of FCal Showers (FCal 2 GeV cut)

# Invariant Mass

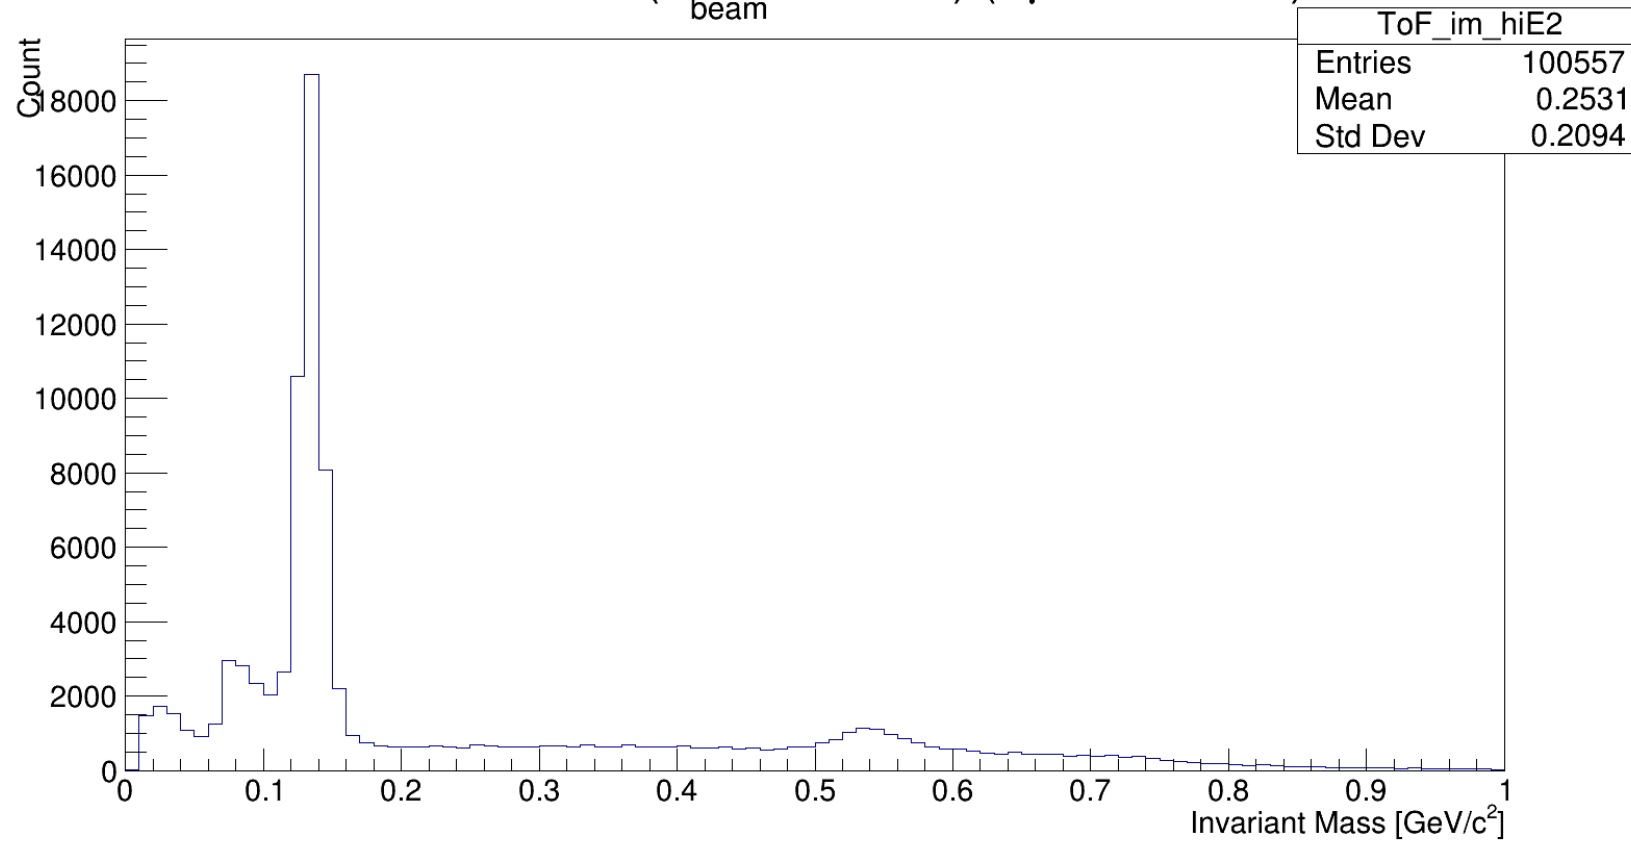

# Pi0 Production Angle

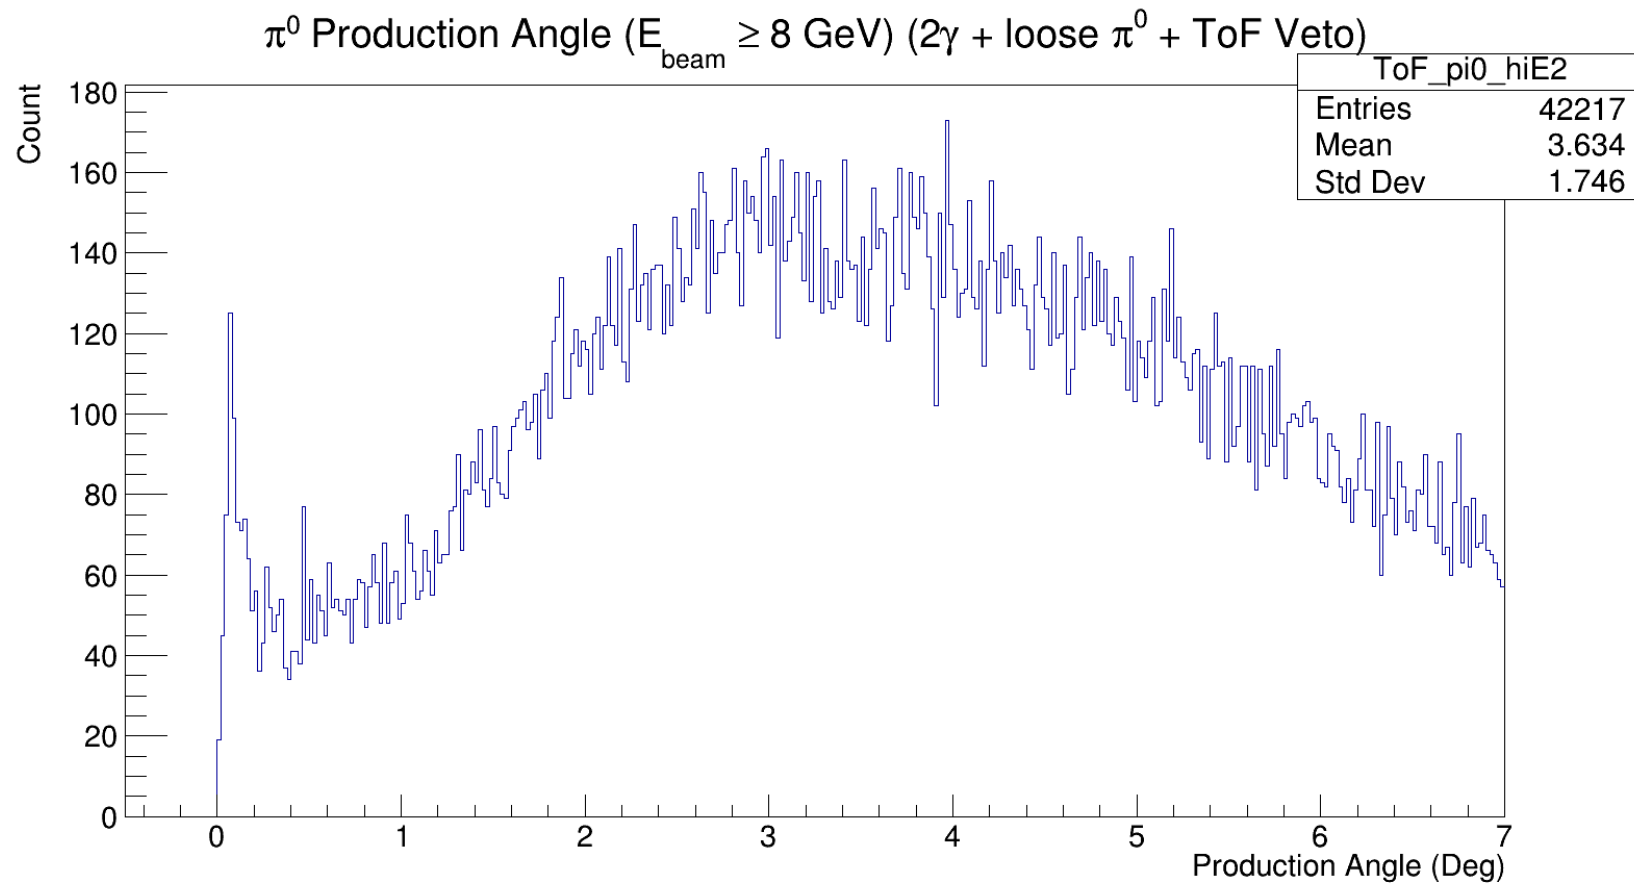

# Invariant Mass

Invariant Mass ( $E_{\text{beam}} \geq 8 \text{ GeV}$ ) ( $2\gamma$  + ToF Veto)

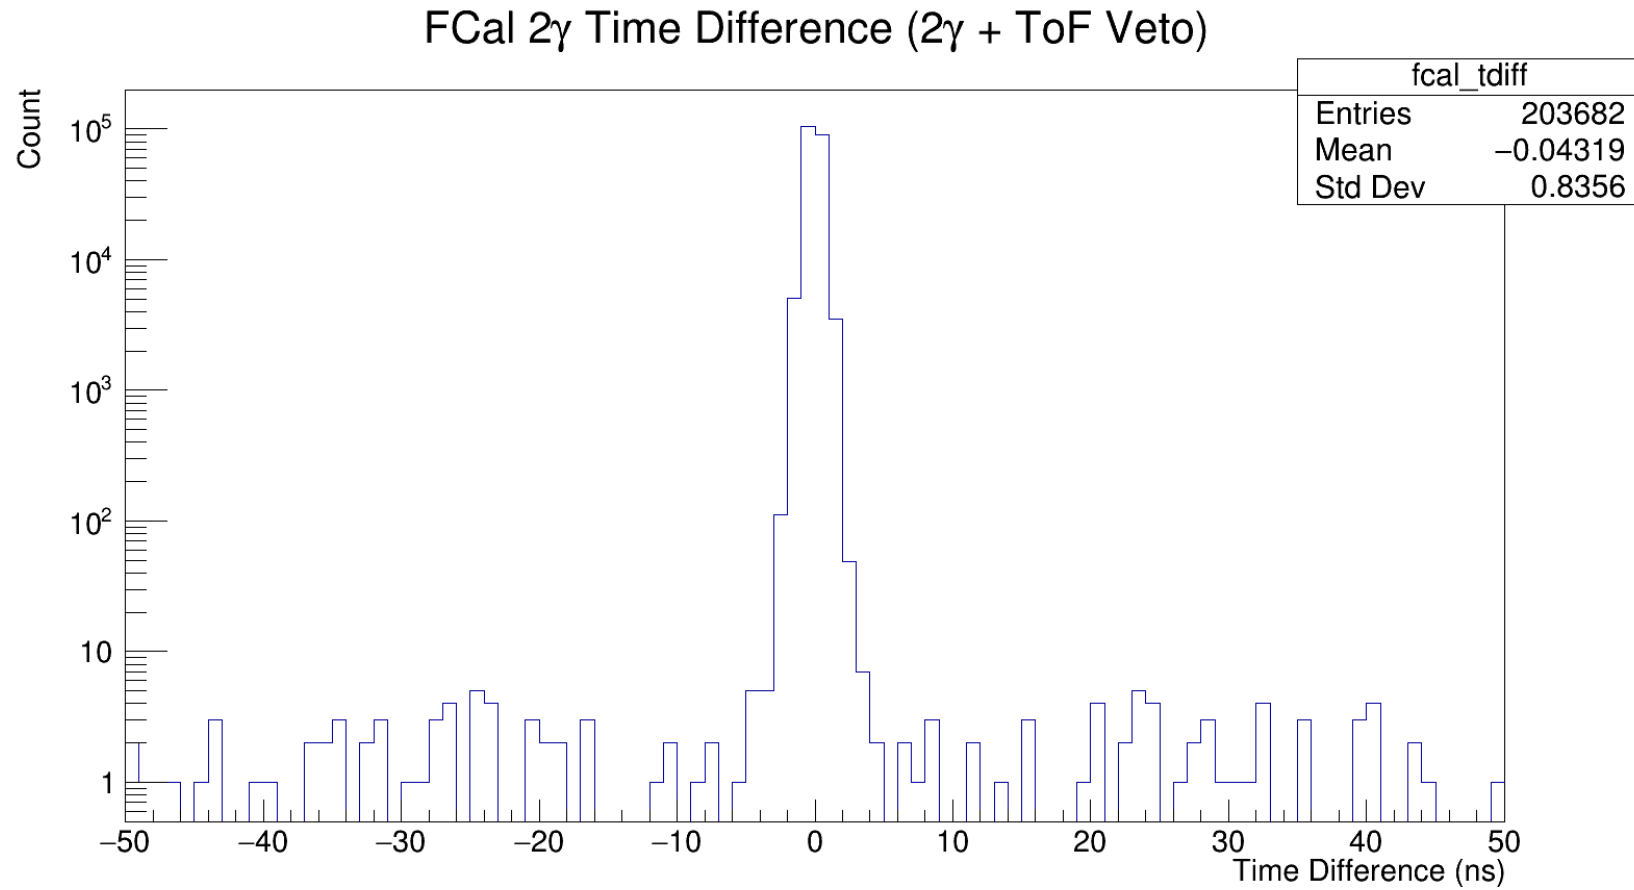

# Pi0 Production Angle

# FCal Shower Timing

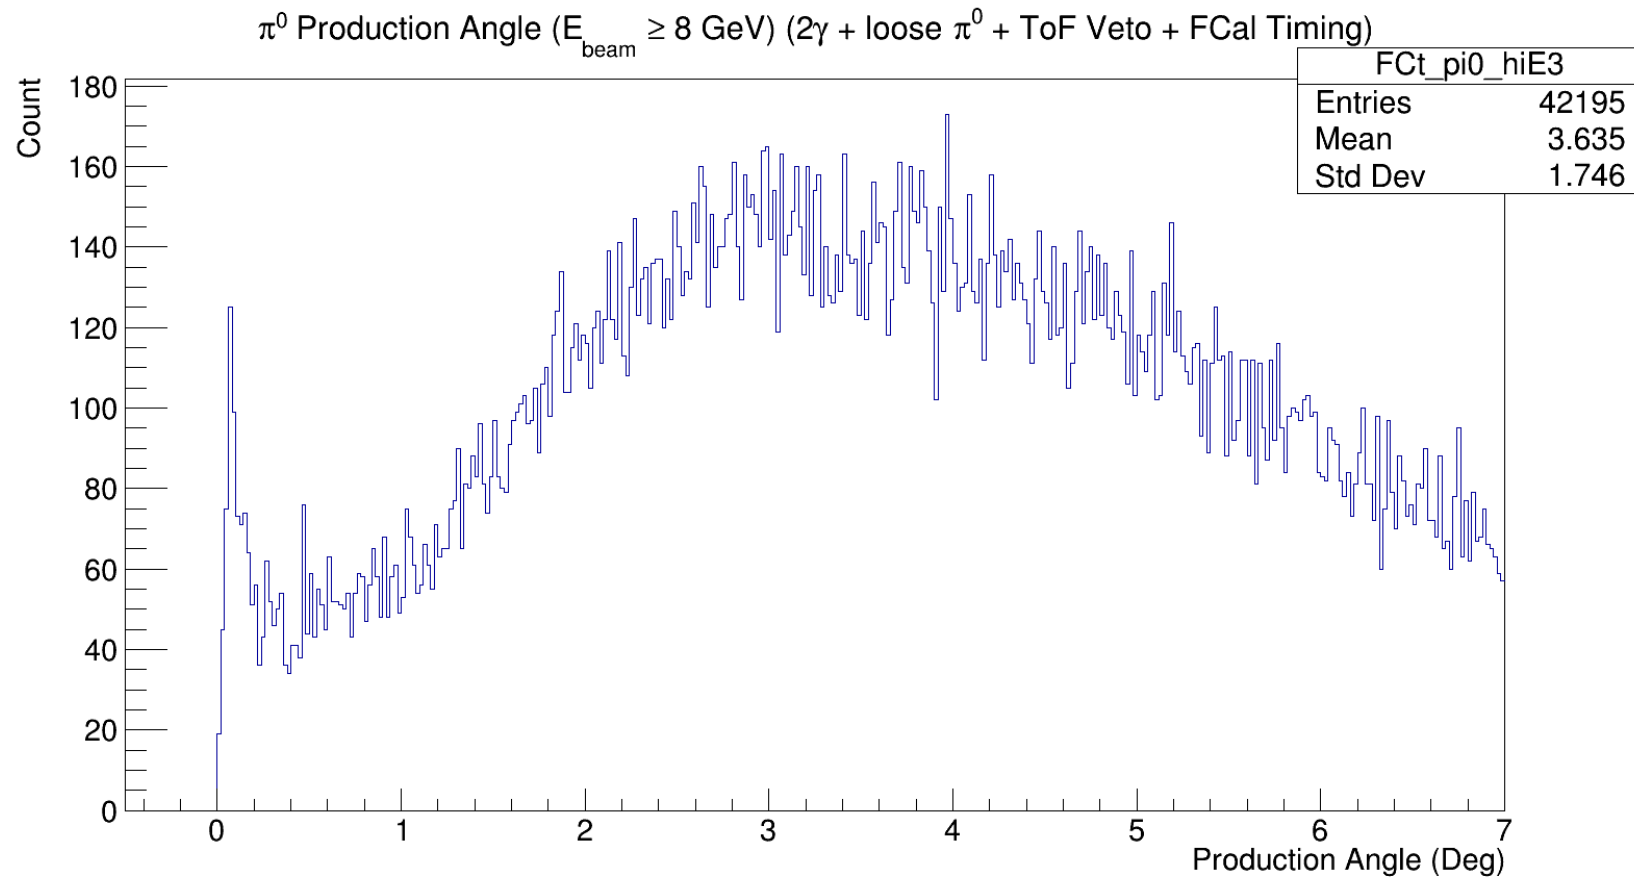

# Invariant Mass

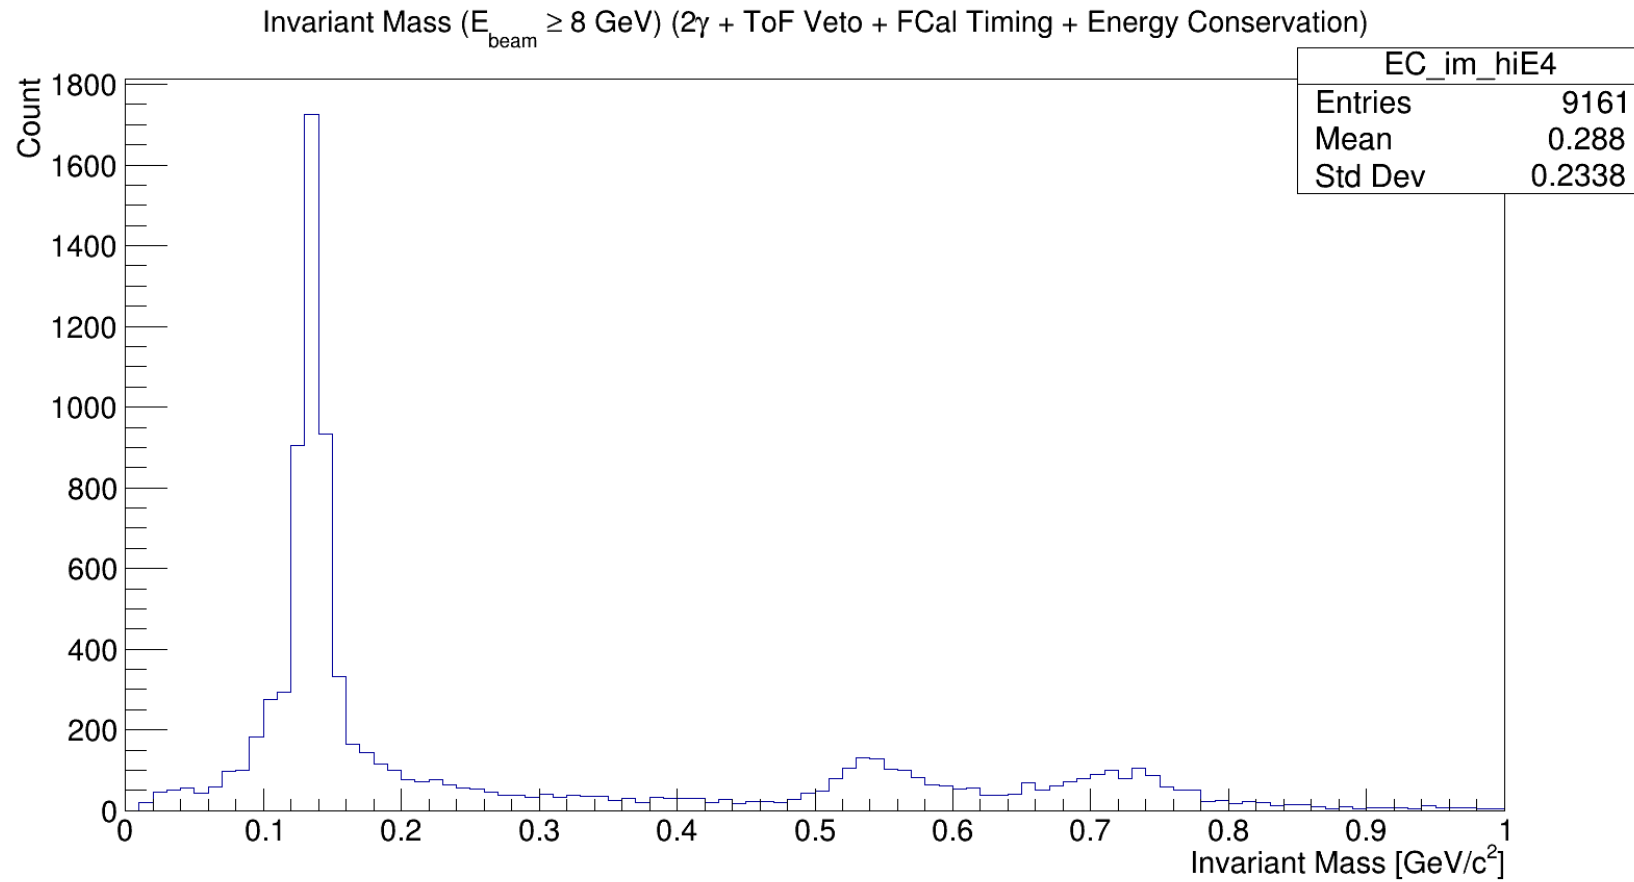

Invariant Mass ( $E_{\text{beam}} \geq 8 \text{ GeV}$ ) ( $2\gamma$  + ToF Veto + FCal Timing)

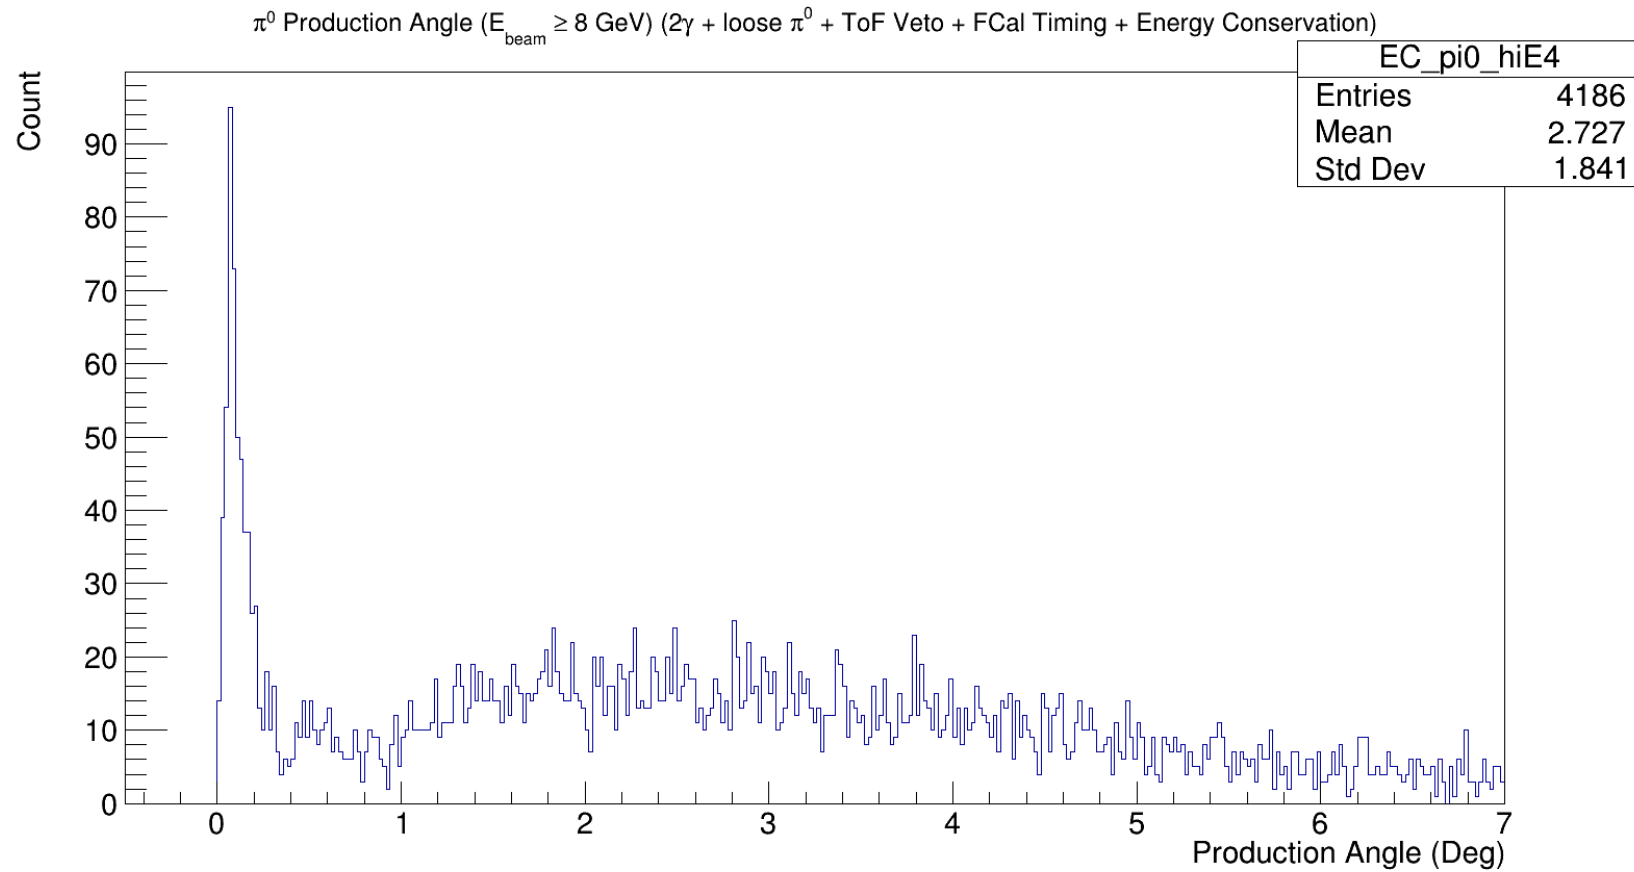

# Pi0 Production Angle

# Invariant Mass

# Pi0 Production Angle

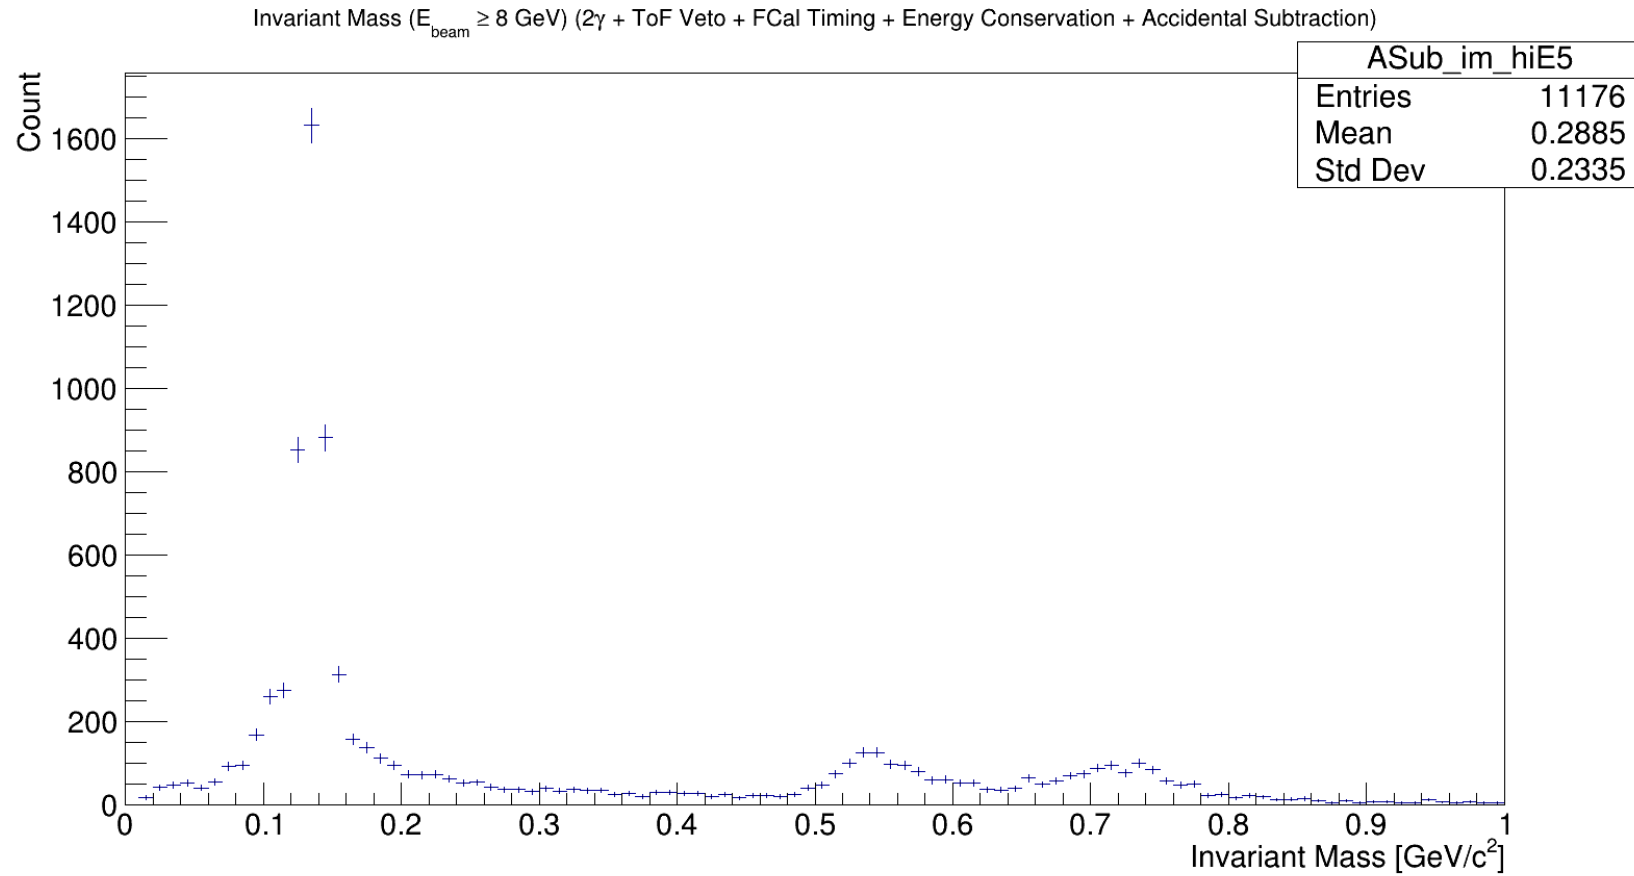

# Energy Conservation

FCal 2 $\gamma$  Energy Conservation ( $E_{\text{beam}} \geq 8$  GeV) (2 $\gamma$  + ToF Veto + FCal Timing)

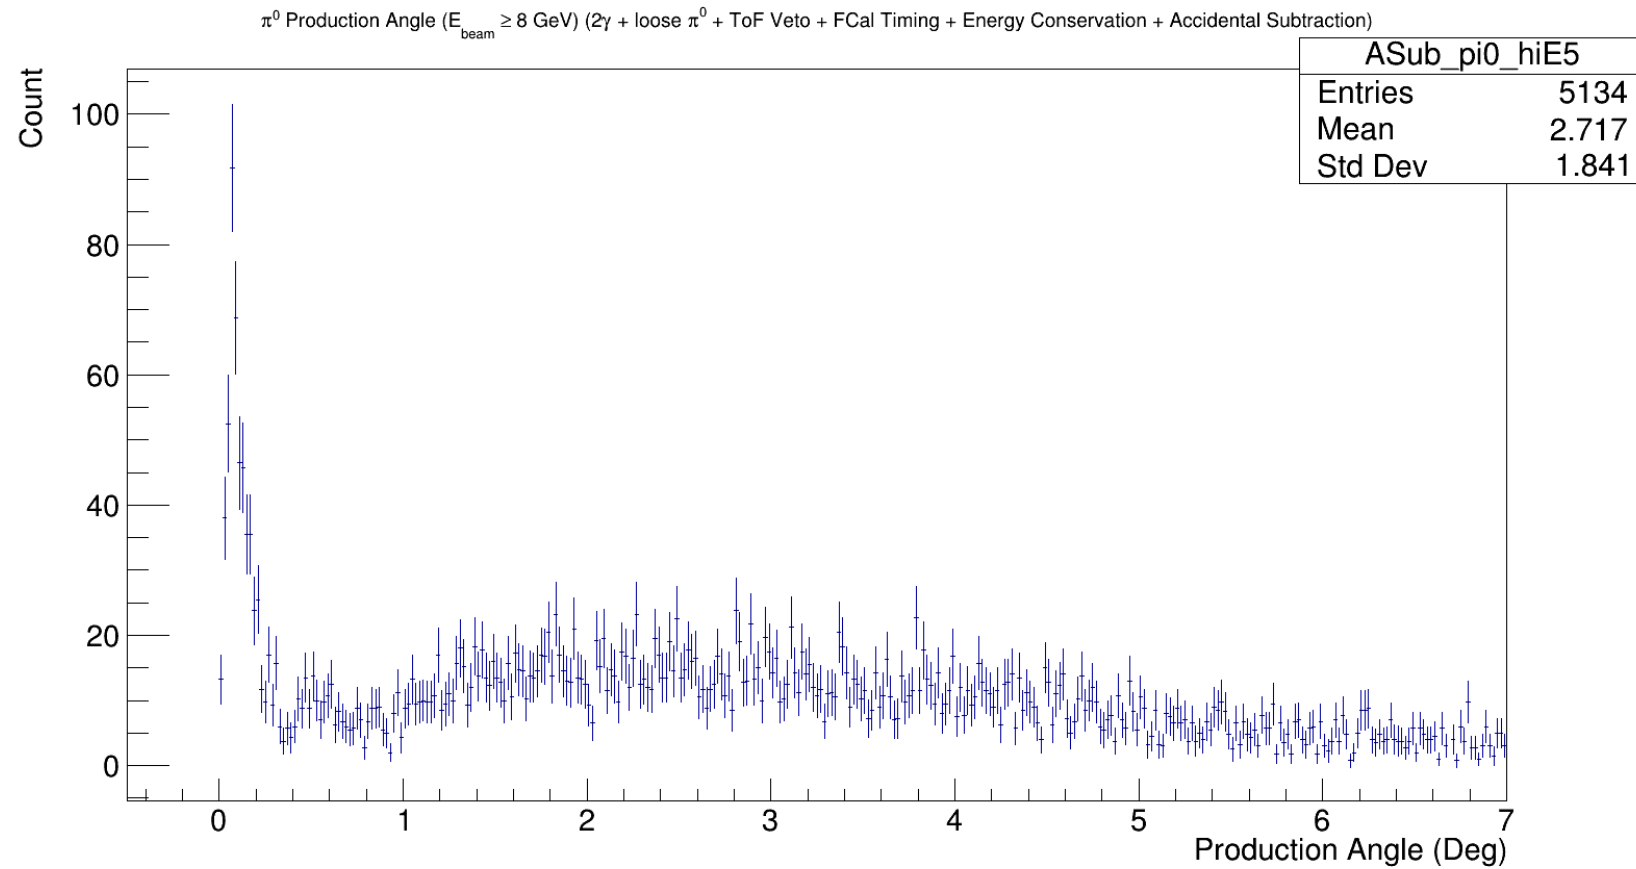

# Invariant Mass

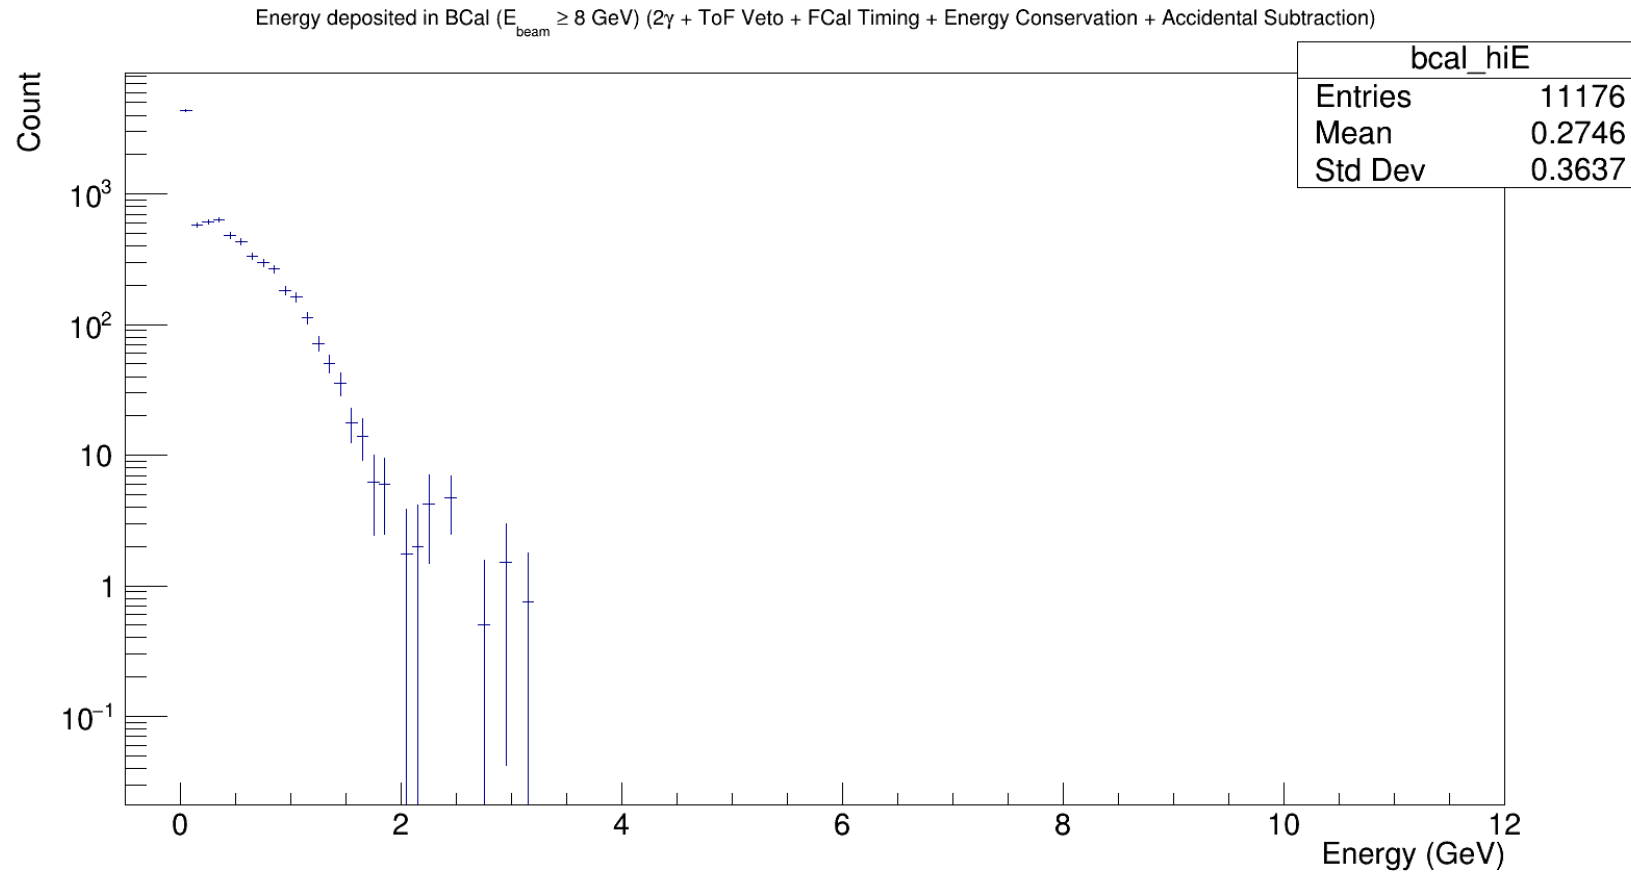

# Pi0 Production Angle

# Energy Deposited in BCal

# Thoughts

- Pi0 Primakoff peak is clearly visible
- Coherent peak disappears with Energy Conservation cut
  - Last week mistakenly attributed this to BCal cut
    - No BCal cut in these plots
  - Is energy conservation cut too tight?
  - Energy conservation cleans up invariant mass peak from inner/outer ring of FCal.
    - Cutting on that first may illuminate a better Energy Conservation cut
- Currently investigating if signal in BCal contains coherent peak
  - VERY loose cut on BCal shower energy (0.1 GeV) just to see if there is any contribution
  - Two photons that make up Pi0 can be in FCal or BCal
  - Code is currently running. Code test on VERY small amount of data suggests there will not be a significant contribution
