## PrimEx-D Run Plan (August - December 2022)

Duration of the run: Aug 27 - Dec 19, 113 days

## General conditions:

- $10^{-4}$ R.L. Al radiator for production runs, $2 \cdot 10^{-5}$ R.L. Al radiator for CCAL calibration and TAC runs
- 5 mm collimator, $750 \mu \mathrm{~m}$ Be PS converter
- Targets: Be and LHe4
- Solenoid magnet switched ON for most production runs except Compton calibration runs on Be target (see below), all sub-detectors are switched on
- Beam current and conditions for drift chambers

Solenoid Magnet ON, production on He target

| CDC / FDC | ON | 200 nA |
| :---: | :---: | :---: |

Solenoid Magnet OFF, Compton Calibration on Be target

| CDC $/$ FDC | OFF | 200 nA |
| :---: | :---: | :---: |
| CDC $/$ FDC | ON | $50 \mathrm{nA}, 100 \mathrm{nA}$ |

Trigger type: CCAL \& FCAL, FCAL, FCAL \& ST (TBD)
PS, random, front panel LEDs

Sequence of the planned work: see the Table on the next page:

## Beam Restoration and Detector Calibration

|  | Time <br> (shifts) | Beam <br> current <br> (nA) | Radiator <br> $(\mathrm{X} 0)$ | CCAL <br> position | TAC <br> position | Solenoid <br> field | CDC/FDC |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No target |  |  |  | retracted | retracted | on | on |
| -Tune beam to tagger Hall <br> -Ion chamber calibration <br> Radiation Monitor check <br> -Harp scan for the electron <br> beam | 0.6 | 0.3 | 0.2 | $10-100$ | $10^{-4}$ |  |  |
| - Radiation Monitor check <br> - PS harp scan <br> - Active collimator check | 0.2 | $10-100$ | $10^{-4}$ |  |  |  |  |
| 0.5 | 1 | $10-100$ | $10^{-4}$ | inserted | retracted |  |  |
| Initial detector check out <br> - TAGH, PS voltage scan <br> - TAGM voltage scan, <br> CCAL, TAC | 8 | $\sim 2$ | $2 \cdot 10^{-5}$ | Snake scan <br> in the beam | inserted |  |  |
| Equalize CCAL gains <br> (calibrate CCAL) | 2 | $\sim 2$ | $2 \cdot 10^{-5}$ | in the beam | inserted |  |  |
| TAC run | 2 | 200 | $10^{-4}$ | inserted | retracted | on | on |
| Production on Be empty <br> target | 1.5 | 50 | $10^{-4}$ | inserted |  | ramping |  |
| down | on |  |  |  |  |  |  |
| Switch off solenoid <br> magnet (target change) | 2 |  |  |  |  |  |  |

## Total

## Production on Be target

|  | Time <br> (shifts) | Beam <br> current <br> (nA) | Radiator <br> $\left(\mathrm{X}_{0}\right)$ | CCAL <br> position | TAC <br> position | Solenoid <br> field | CDC/FDC |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Install Be target <br> mount, install ST, align | 3 |  |  |  |  | off | on |
|  |  |  |  |  |  |  |  |
| Switch on solenoid magnet | 1.5 | 50 | $10^{-4}$ | inserted | retracted |  |  |
| Trigger and DAQ study <br> for physics | 2 | $10-100$ | $10^{-4}$ |  |  | on | on |
| Detector checkout and <br> calibration <br> - raw mode for ADCs <br> Take data for FCAL gain <br> equalization and calibration | 3 | $10-100$ | $10^{-4}$ |  |  |  |  |
| FCAL HV tuning | 1 |  |  |  |  |  |  |
| Data production |  |  |  |  |  |  |  |
| Compton run at small beam <br> current (Be target) | 2 | 50 | $10^{-4}$ |  |  |  |  |
| Compton run at the nominal <br> beam current | 8 | 200 | $10^{-4}$ |  |  |  |  |
|  | 2 | 100 |  |  |  |  |  |
| Switch off solenoid <br> magnet | 1.5 | 50 | $10^{-4}$ |  |  |  |  |
|  |  |  |  |  |  |  | off |
| FDC straight track run | 0.5 | 50 | $10^{-4}$ |  |  |  | off |
| Compton run at small beam <br> intensity (Be target) | 2 | 50 | $10^{-4}$ |  |  | on |  |
| Compton run at the nominal <br> beam current | 4 | 200 | $10^{-4}$ |  |  |  |  |

Total
$\sim 7.5$ days

## Production on LHe target

|  | Time <br> (shifts) | Beam <br> current <br> (nA) | Radiator <br> $\left(\mathrm{X}_{0}\right)$ | CCAL <br> position | TAC <br> position | Solenoid <br> field | CDC/FDC |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Install LH4 target <br> mount, install ST, align | 3 |  |  |  |  | off | off |
|  |  |  |  |  |  |  |  |
| Fill the target <br> Switch on solenoid magnet | 1.5 |  |  |  |  |  |  |
| Production run at the <br> nominal luminosity | 5 | 200 | $10^{-4}$ | inserted | retracted | on | on |
| Production run at small <br> Luminosity | 2 | 50 | $10^{-4}$ |  |  |  |  |
| High luminosity run <br> (optional) | 2 | 100 |  |  |  |  |  |
| Alternate production runs <br> with the empty target runs <br> $70 \% / 30 \%$ | the rest <br> of the run | 200 | $10^{-4}$ |  |  |  |  |

Time is estimated assuming that the accelerator beam efficiency is better than $50 \%$.
One shift corresponds to 6 hours
Detector preparation:
