Hi all,

In updating mcsmeas, one of the issues I wanted to address was that the current SC resolutions in CCDB contain contributions both from the Start Counter and tracking, due to the method that is used to determine them. To remove the tracking contribution, I made a MC study summarized here:

https://halldweb.jlab.org/wiki/index.php/SC_mcsmeas_resolutions

My proposal is to use the function determined from MC to obtain the "true" SC-only resolutions from the measured resolutions and add those to the CCDB. Maybe we can discuss this at a meeting somewhere.

Cheers,
Sean
