# DSelector Uniqueness Tests Bug Fix 

Benedikt Zihlmann

## Bug Fix in DSelector usage

The DSelector method Get_NumNeutralHypos () does not return the total number of reconstructed photons in the event. It returns the total number of independent photons used collectively for all combos. In order to get the total number of reconstructed photons for a given event as seen by the reaction filter in the REST file one has to use the ComboWrapper method Get_NumUnusedShowers () and add this number to the total number of photons required for the reaction. In the case of the reaction

$$
\begin{aligned}
\gamma+p & \rightarrow \eta^{\prime}+p \rightarrow \pi^{+}+\pi^{-}+\eta+p \\
& \rightarrow \pi^{+}+\pi^{-}+\pi^{0}+\pi^{0}+\pi^{0}+p \\
& \rightarrow \pi^{+}+\pi^{-}+\gamma+\gamma+\gamma+\gamma+\gamma+\gamma+p
\end{aligned}
$$

the total number of reconstructed photons in a given event is 6 + dComboWrapper->Get_NumUnusedShowers ()

## Chi2 distribution

This misconception manifests itself for example in the chi2 distribution of events with exatly 6 reconstructed photons and more than 6 reconstructed photons.

## Chi2/NDF with OLD code:

Chi2/df Events with more than 6 Photons

Chi2/NDF with NEW code:

## Statistics consequences

As a consequence the statistics of events with exately 6 FS photons is reduced relative to the events with more than 6.

| $\chi^{2} / N D F$ | Weight | $\operatorname{pos}(6)$ | $\sigma(6)$ | $\mathrm{I}(6)$ | $\operatorname{pos}(7,8)$ | $\sigma(7,8)$ | $\mathrm{I}(7,8)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
