

Parameters at 1.2 V over BDV
Orlando Soto S.

In the next slides different parameters are shown at 1.20 [V] over breakdown voltage.

There are three slides per each parameter. The first one shows the parameter for each mppc id measured, the second one shows the projection onto the y-axis of the picture on the first slide, the last one shows the dispersion of the 16 cells within each mppc.

The parameters are: Operational Voltage, Gain, Cross-Talk, Dark Rate and Amplitude.

The formulas used in amplitude are:

$$Mean_{\mu_i \cdot G_i} = \frac{1}{16} \cdot \sum_{k=1}^{16} \mu_{ik} \cdot G_{ik}; \quad RMS_{\mu_i \cdot G_i} = \sqrt{\frac{1}{16} \cdot \sum_{k=1}^{16} (\mu_{ik} \cdot G_{ik})^2 - Mean_{N_{phei} \cdot G_i}^2}$$

With μ_{ik} an G_{ik} Average number of photo-electrons and gain for mppc i and cell k respectively.

The formulas used in Dark Rate:

$$Dark Rate = \frac{N_{outside pedestal}}{N_{inside pedestal} \cdot gate \cdot 10^6}$$
