

Differential Cross Section Extraction

Jackson Pybus

Using side-band subtraction to determine differential distributions

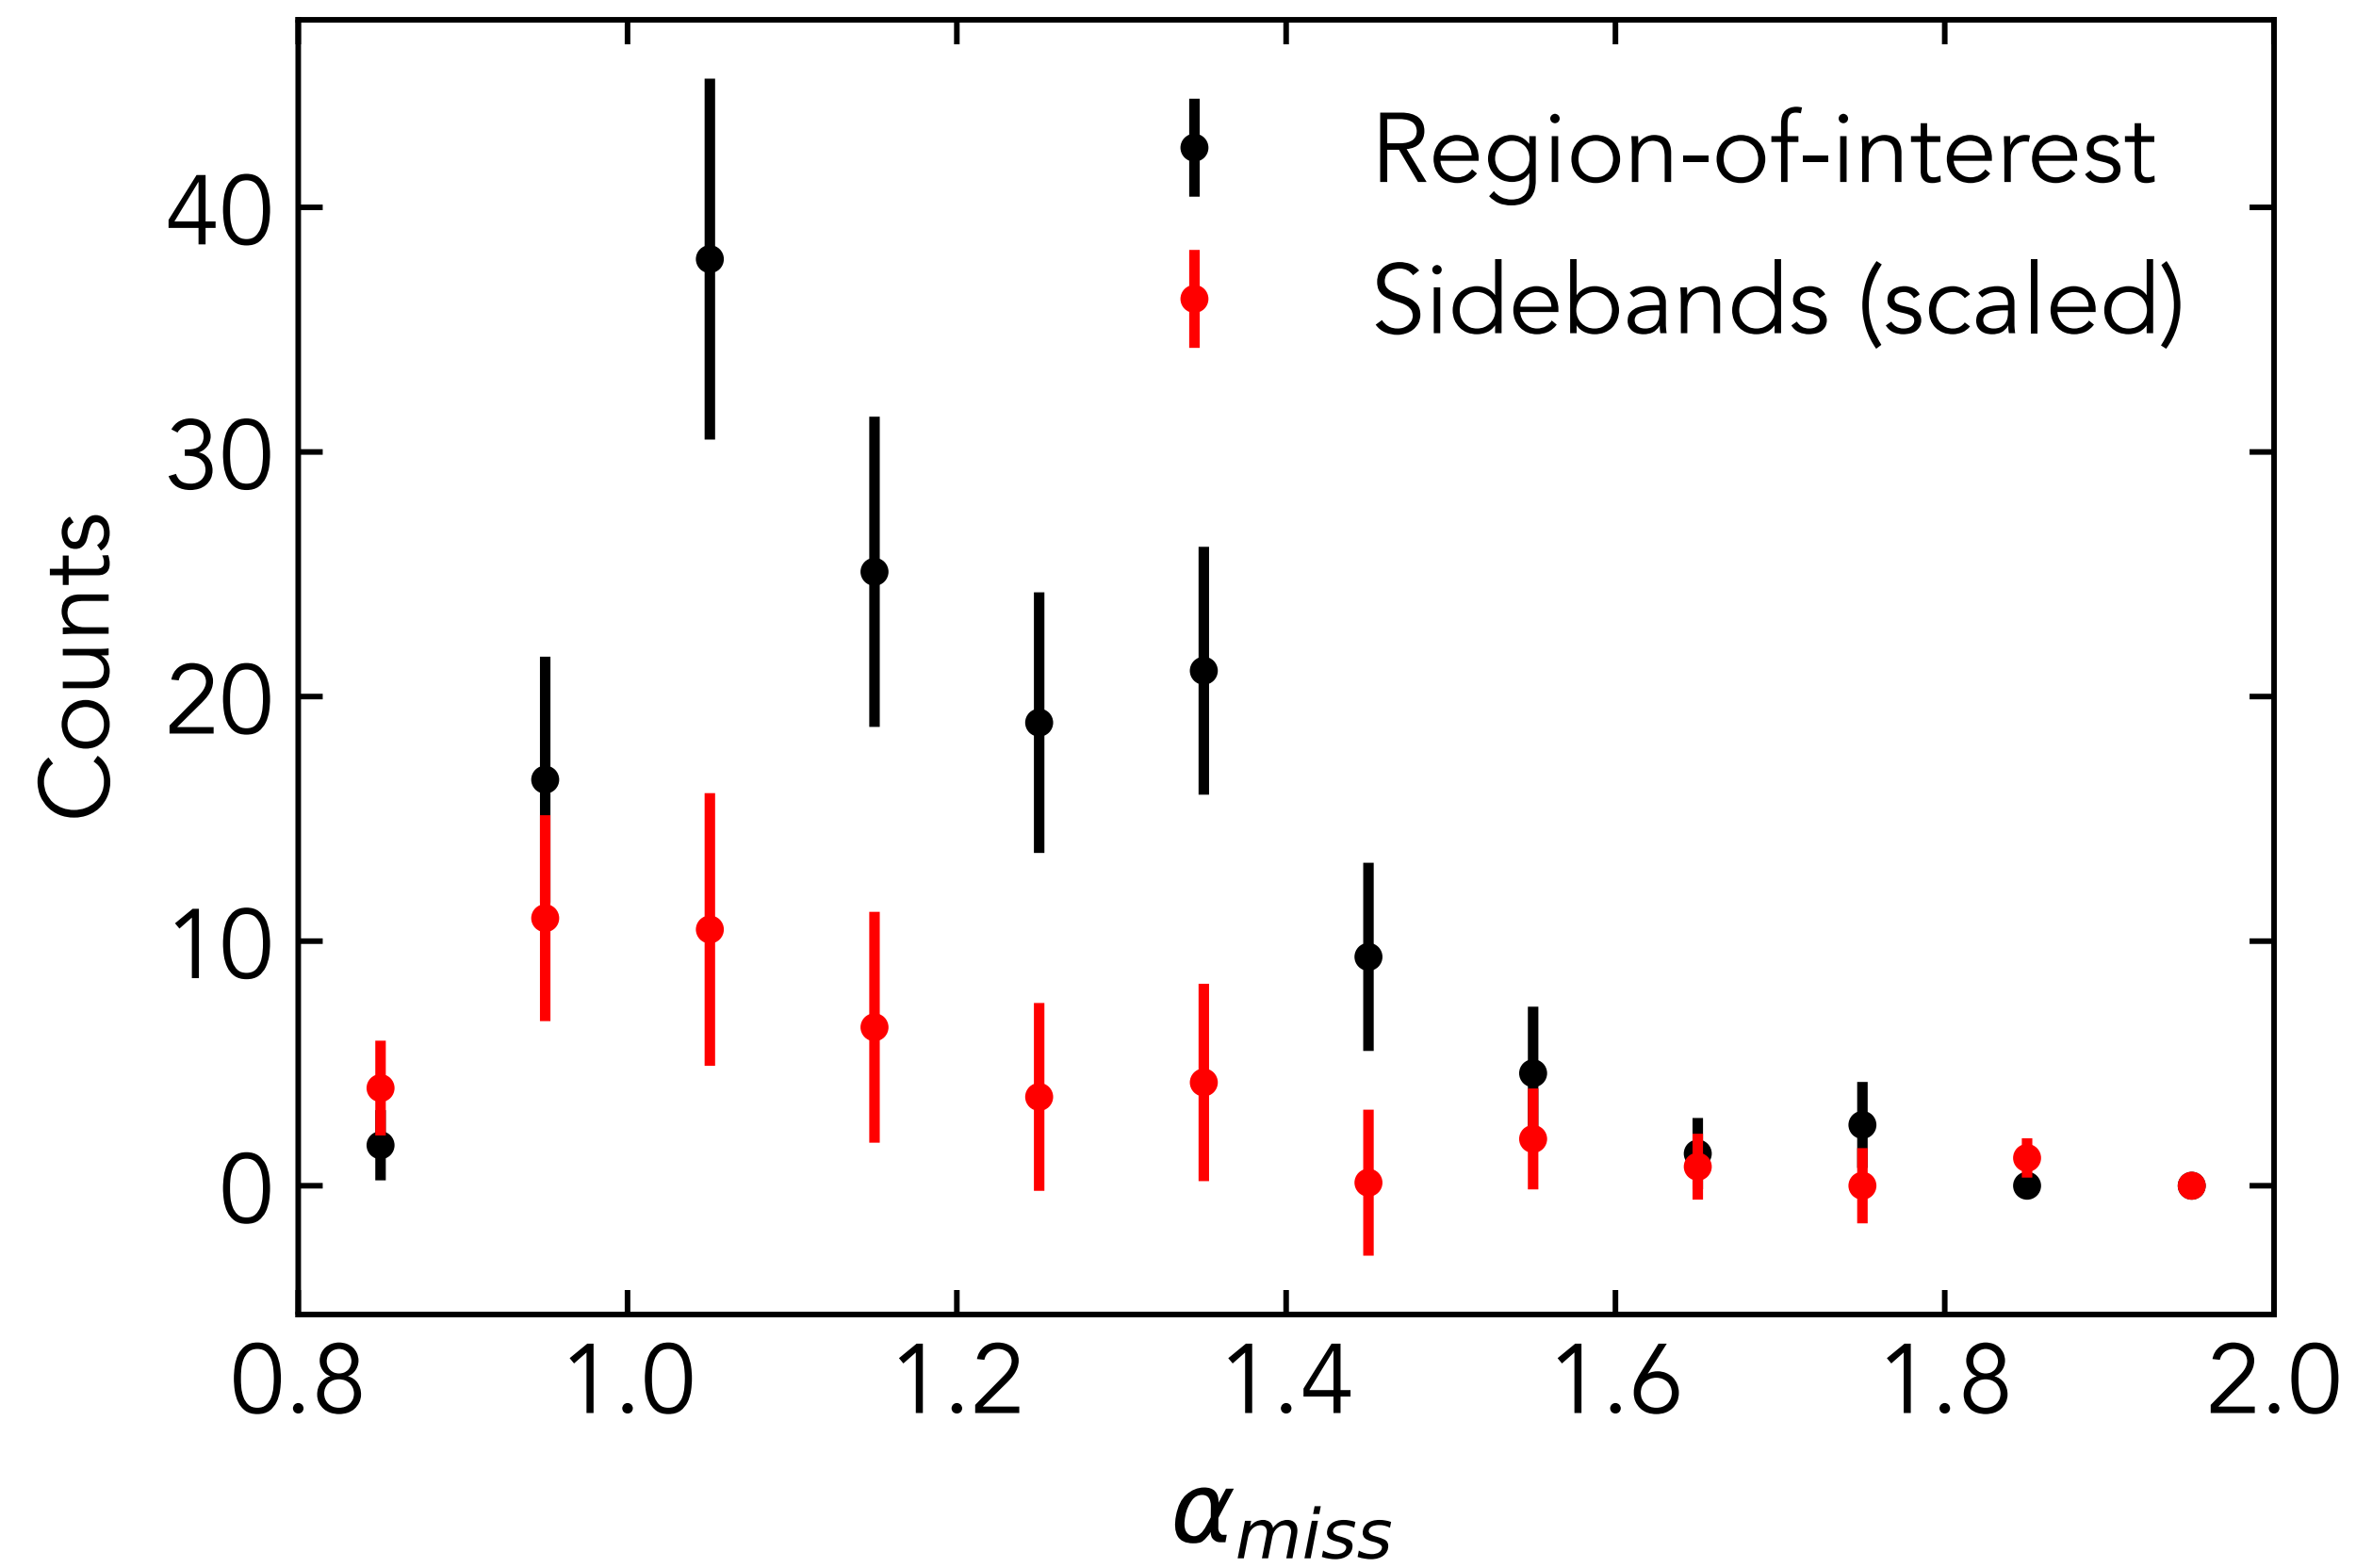

Using side-band subtraction to determine differential distributions

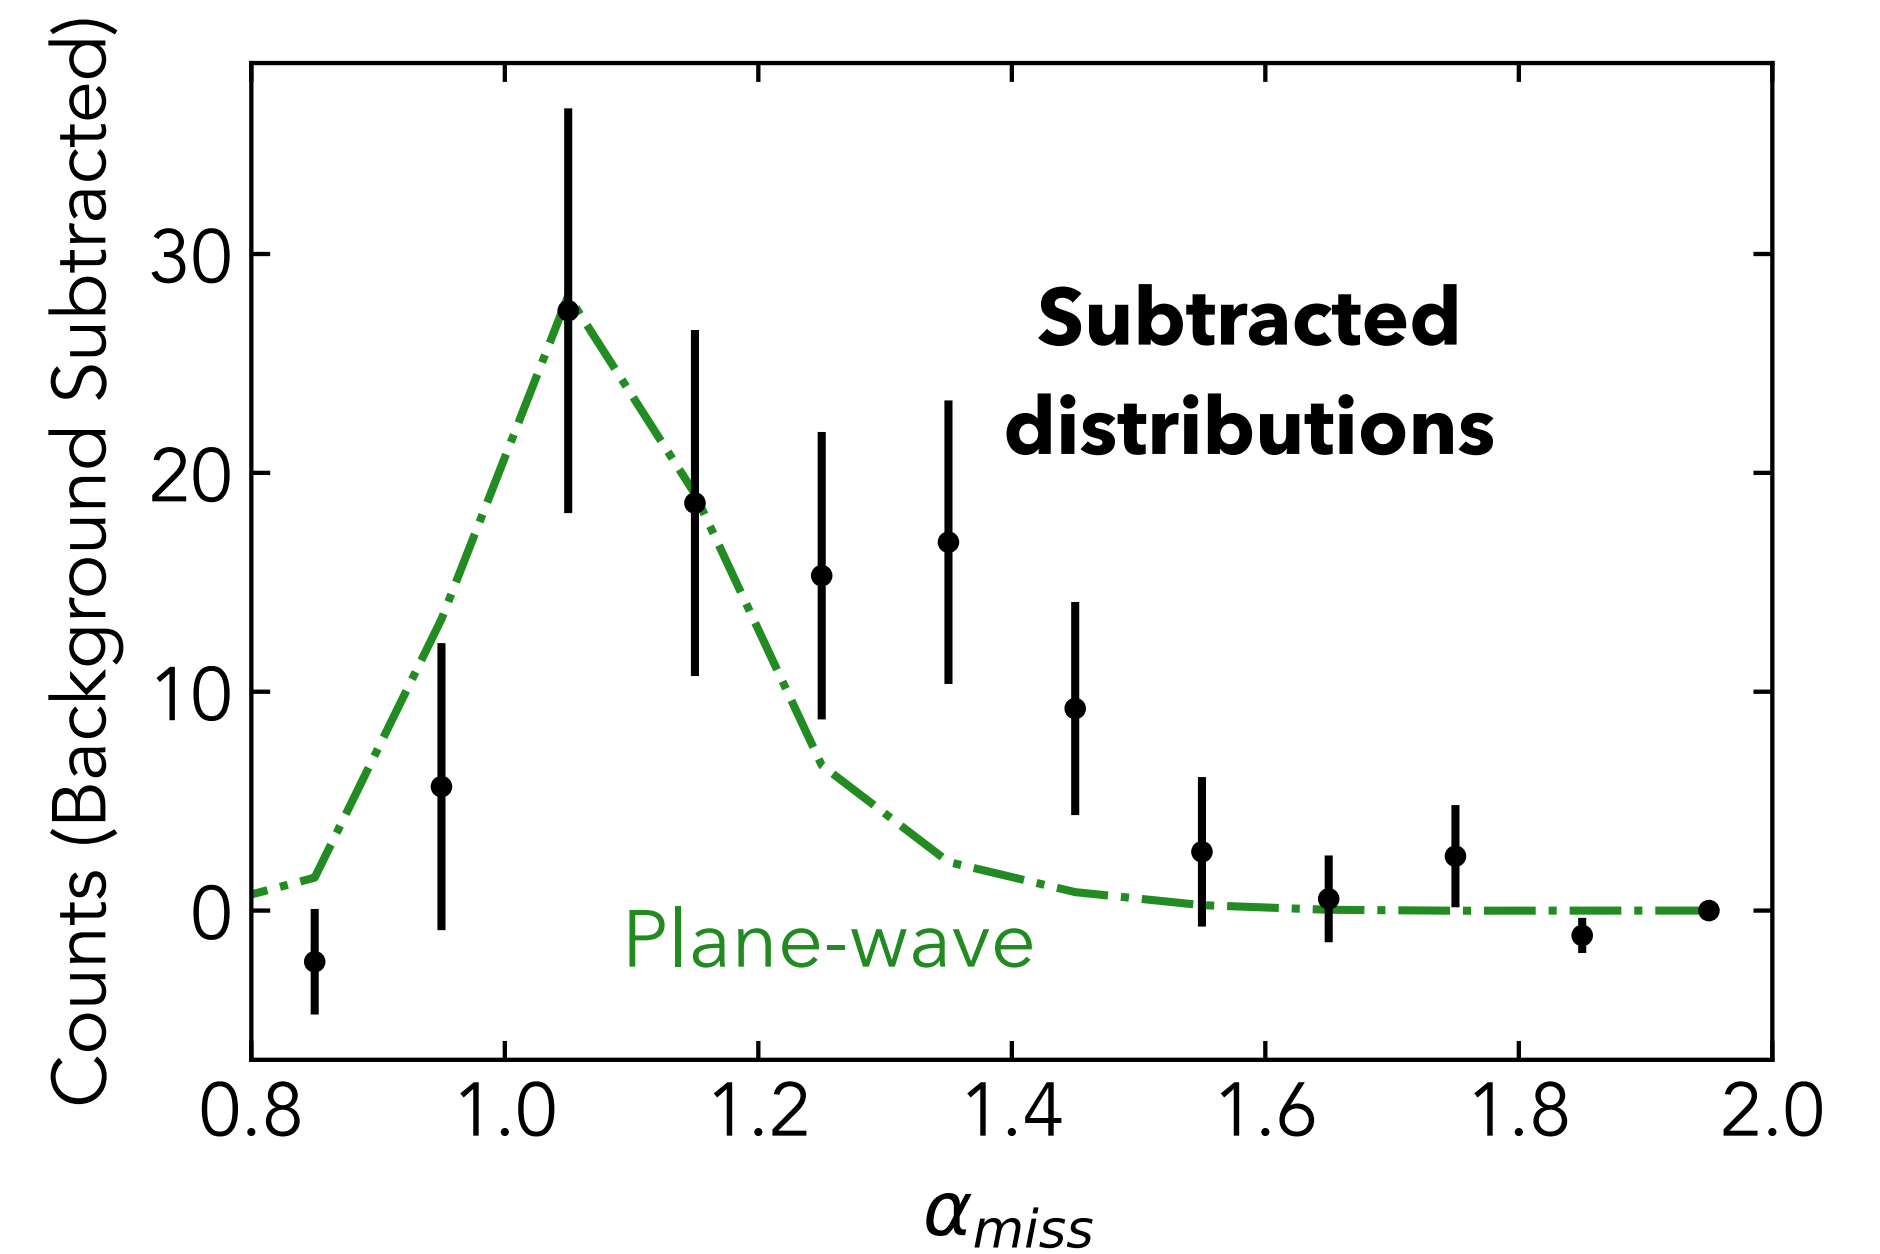

Using side-band subtraction to determine differential distributions

Examine distribution in ROI and side-bands

Examine distribution in ROI and side-bands

Monte-carlo calculations of kinematic-dependent efficiency

Differential cross section calculated with given quantities

Differential Cross Section

Event yields

$$\frac{d\sigma}{dX} = \frac{Y(X)}{\mathcal{L} \times \epsilon(X) \times T \times B(J/\psi \rightarrow e^+e^-) \times \Delta X}$$

Luminosity

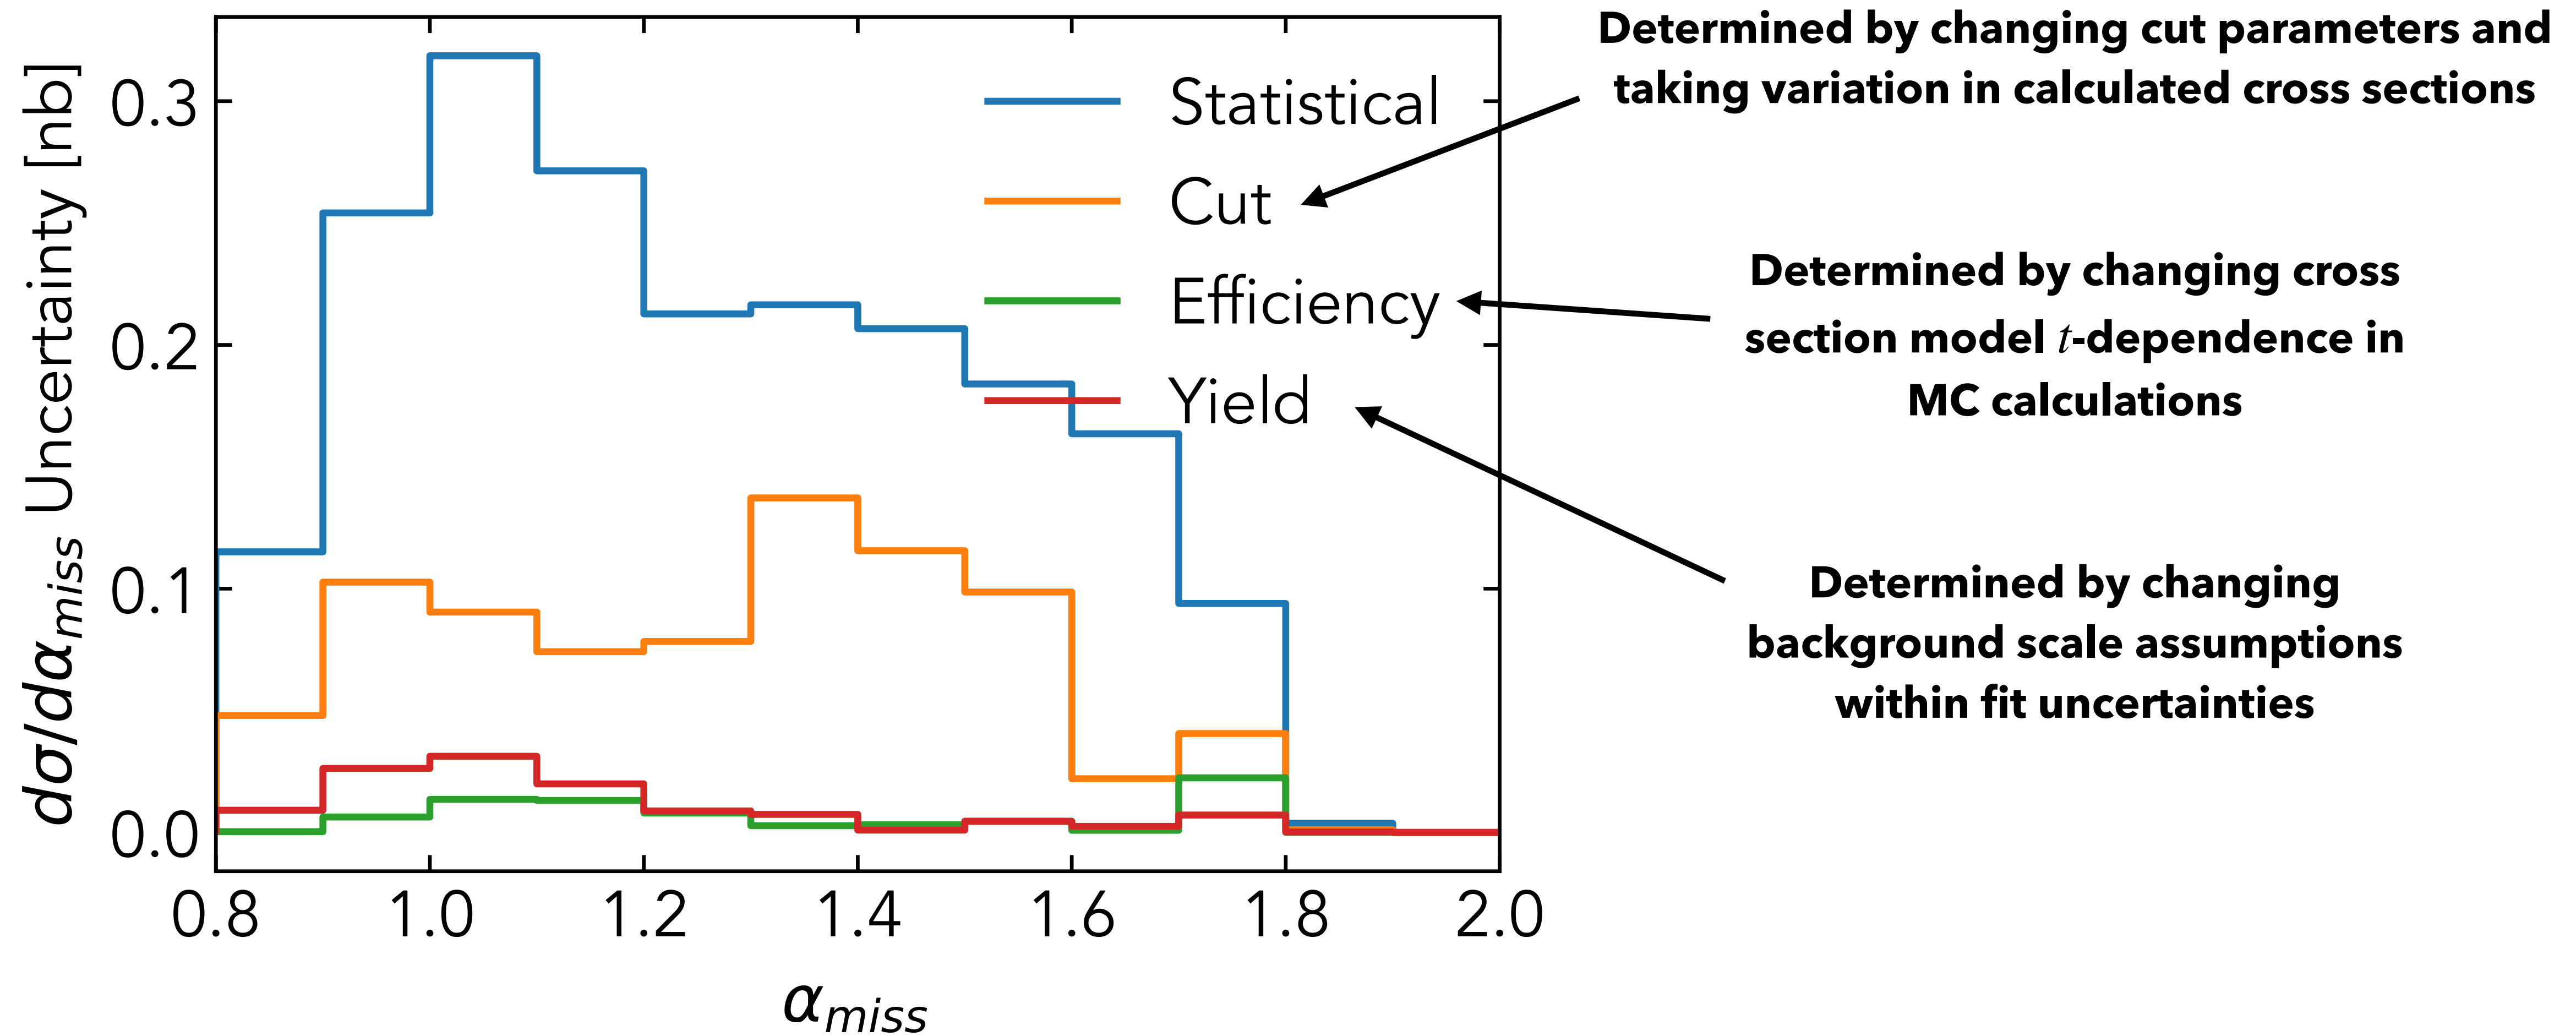

Efficiency

Proton Transparency

Branching Fraction

Bin width

Quantify sources of uncertainty

Differential cross section extracted and compared with plane-wave

$7 < E_\gamma < 10.6$ GeV

Separately extracted for different energy bins

Can compare with different proton modification models
