

π^0 acceptance of the GlueX detector, Pb target, 0.028 cm thick,
 $Z_0=65$ cm, Z-shift=-1 cm

Alexander Mushkarenkov

April 4, 2013

Generated and reconstructed π^0

- ▶ $\pi^0 \rightarrow \gamma\gamma \approx 98.8\%$, $\pi^0 \rightarrow \gamma e^+ e^- \approx 1.17\%$;
- ▶ Pb target, 0.028 cm thick, $Z_0=65$ cm, Z-shift=-1 cm;
- ▶ The start counter removed;
- ▶ only the "Gamma" hypotheses were used;
- ▶ if > 2 "Gamma" hypotheses in a event then a pair producing the minimal $d = |m_{\gamma\gamma} - m_{\pi^0}|$ were selected;
- ▶ $|m_{\gamma\gamma} - m_{\pi^0}| < 0.025$ GeV.

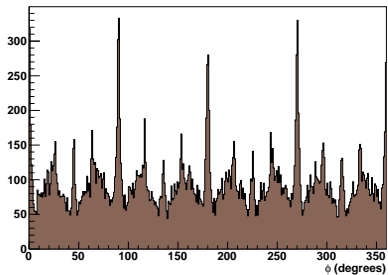

Generated and reconstructed energy of π^0 and γ

Generated and reconstructed θ of π^0 and γ

Generated and reconstructed φ of π^0 and γ

Reconstructed φ vs θ of π^0

Acceptance of π^0

Main source of inefficiency:

- ▶ The central (beam) hole;
- ▶ The detector granularity.
