TRIGGER

fADC

DAQ

The fADC has a constant pipeline of data entering it from the MWPC, broken down into 8 ns frames.

When it receives a trigger from the PMT, it consults a CONFIG file that instructs it on where to start taking data, and for how many 8 ns frames.

ROOT files

The DAQ system creates a ROOT file of the data.

Using software that wraps some of ROOT's functionality, we create a waveform that can be analyzed.

Event 75 ROC:0 SLOT:3 CHAN:7

Using the ROOT files in drift time studies

PEAK DETECTION ALGORITHM:

Constant Fraction Method with some modifications

Voltages for 10^5 gain on MWPC power supply

Ar:CO_2 80:20 2020 Volts

Ar:CO_2 90:10 1820 Volts

Freon 2125 Volts

Voltage for NaI PMT power supply 1400 V

Discriminator threshold for PMT signal 390 mV

Peak Condition:

$$\text{max} - \text{baseline} \geq \text{baseline} \times \text{threshold1}$$

Set by user, about 0.05

Gas Study Results

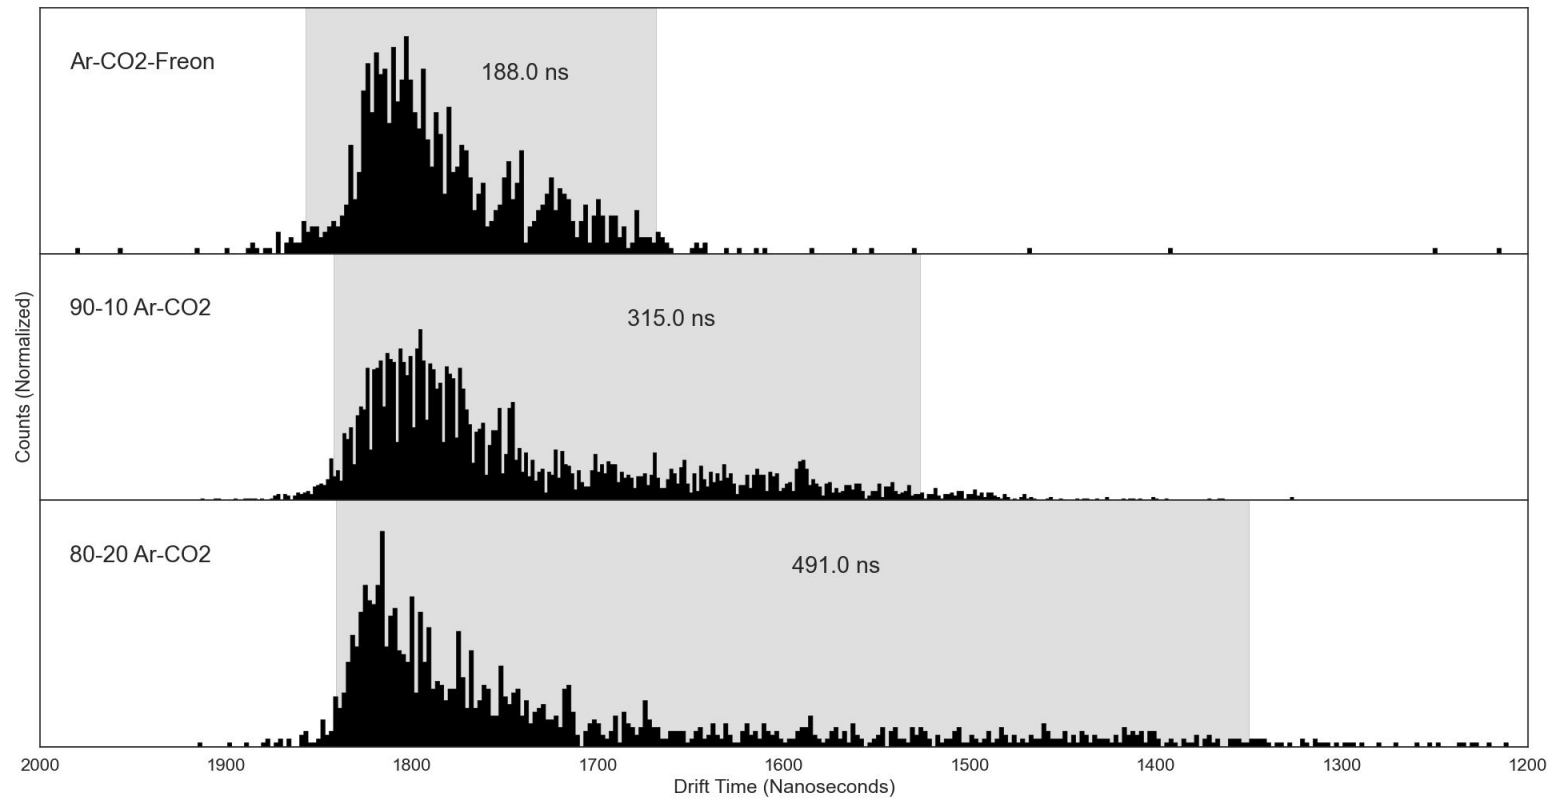

Analyzing the signal from all wires

Gas Study Results

Just analyzing one wire (the 7th in, directly under the PMT)

Gas Study Results

Drift time studies from last summer utilizing ScopeOut
