Current Data Files and Monitoring

GlueX Run Coordination Meeting November 20, 2014 Justin, Kei, Paul, Sean

- Where to look
- 3 min. tutorial on webpages
- Overview of current data, monitoring
- Looking Ahead

Where to Look

Overview of Monitoring

- Have been running offline monitoring on incoming data
- Data taking periods relatively short (<1 day)
- Saving plugin results against svn revision
- Results transferred to webpages (Justin), run info saved in DB (Sean)
- During data taking, we will re-run the offline monitoring on previous runs on Friday evenings

Overview of Current Runs

• Runs:

- 940 996: 1000A field, taken Nov. 6
- 1129 1195: OA field, taken Nov. 16-18
- 1280 1286: 0A field
- Each file contains 1k 200k events
- Many changes in configuration makes simple comparisons difficult
- Several problems during data taking (next slides)

Current Issues

- Online monitoring not working
 - → David L working on this
- Still no way to correlate ADC and TDC timing
 - → Beni working on this
- Data stream has been corrupted by extra "word" for some runs, led to slot 3 not being read out
 - → fix by David L checked in
- DAQ crashing/stopping
 - → Sergey, DAQ group working on this

Looking Ahead

- Sean, David working on unified DB that contains run info
- David's run info page: http://www.jlab.org/Hall-D/test/RunInfo/
- Once current run is over, run offline monitoring over files on raid disks, compare to results from tape
- If there are any requests, comments, etc., please let us know
