

Characterizing Pion Contamination in Bethe-Heitler Study $\gamma p \rightarrow e^+e^-(p)$

Andrew Schick

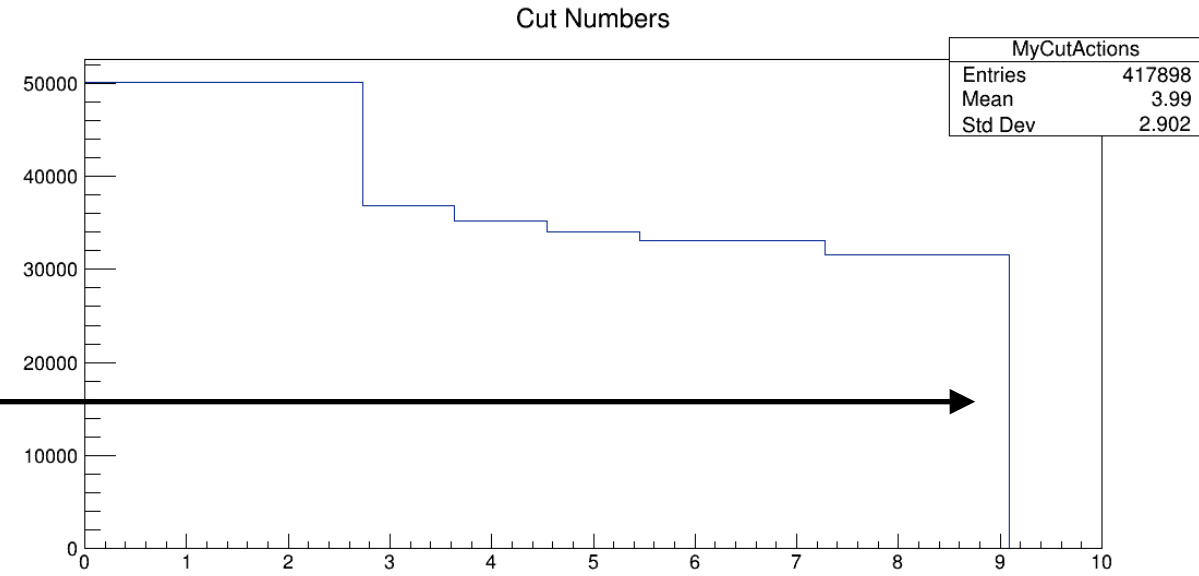

Wednesday, November 6 2019

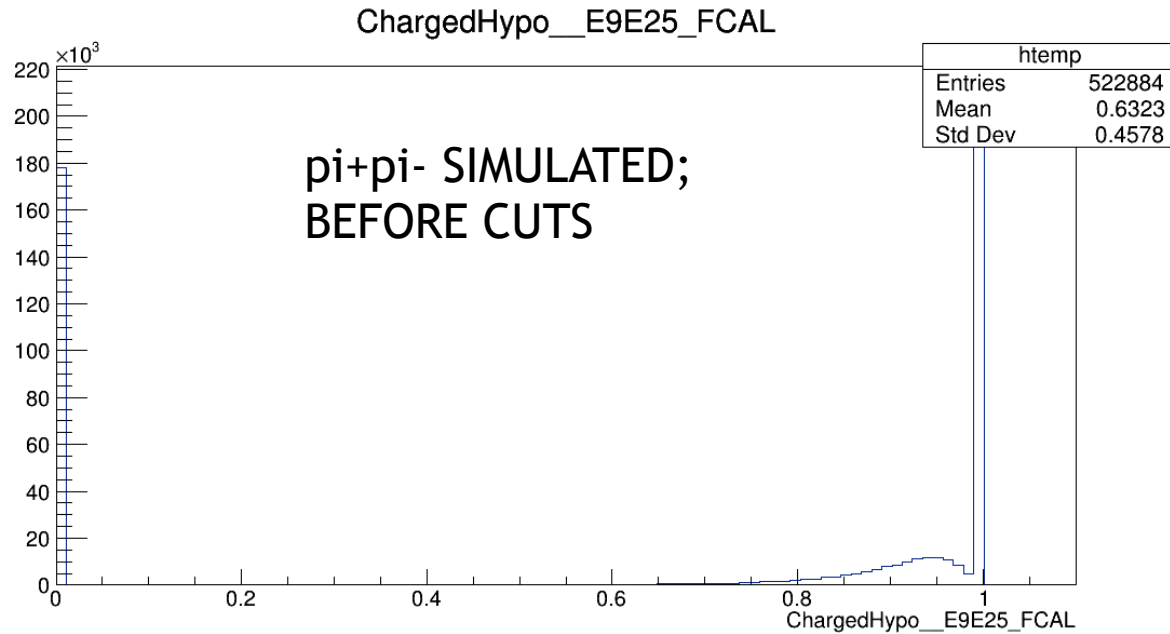

LAST TIME: Wanted to see if E9E25 was a better way to separate pions and electrons.

Idea: throw pions, but run $\gamma p \rightarrow e^+e^-(p)$ reaction filter. See how many pions reconstruct as e^+/e^- .

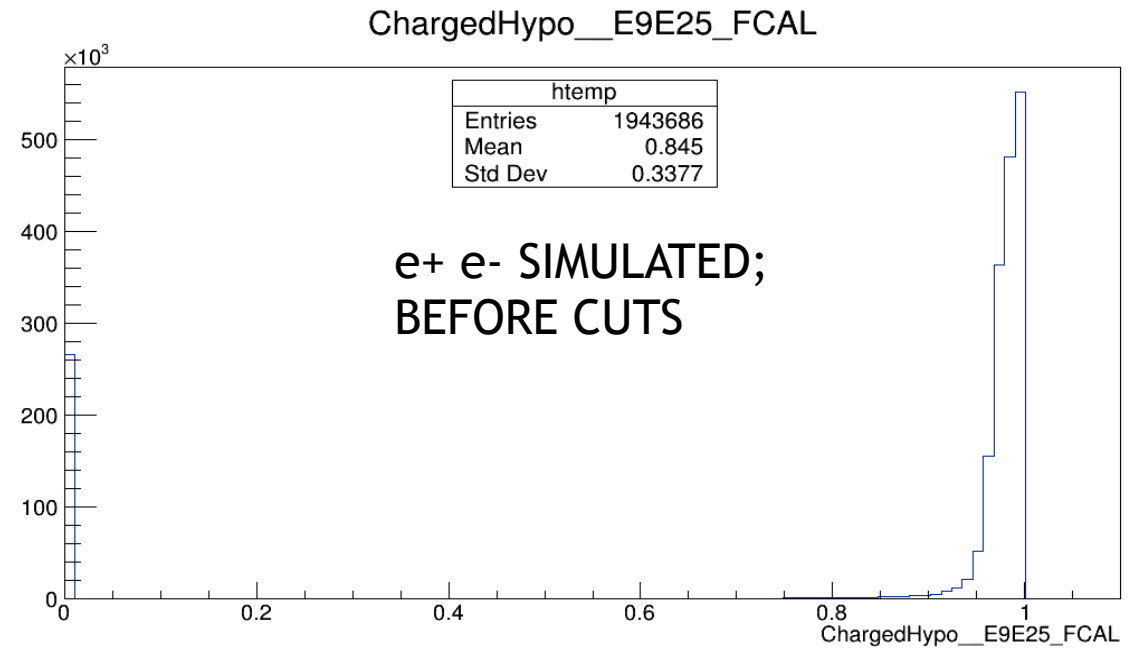

BUT.... *First E/p cut
Kills all pions*

Can at least compare REST files though:

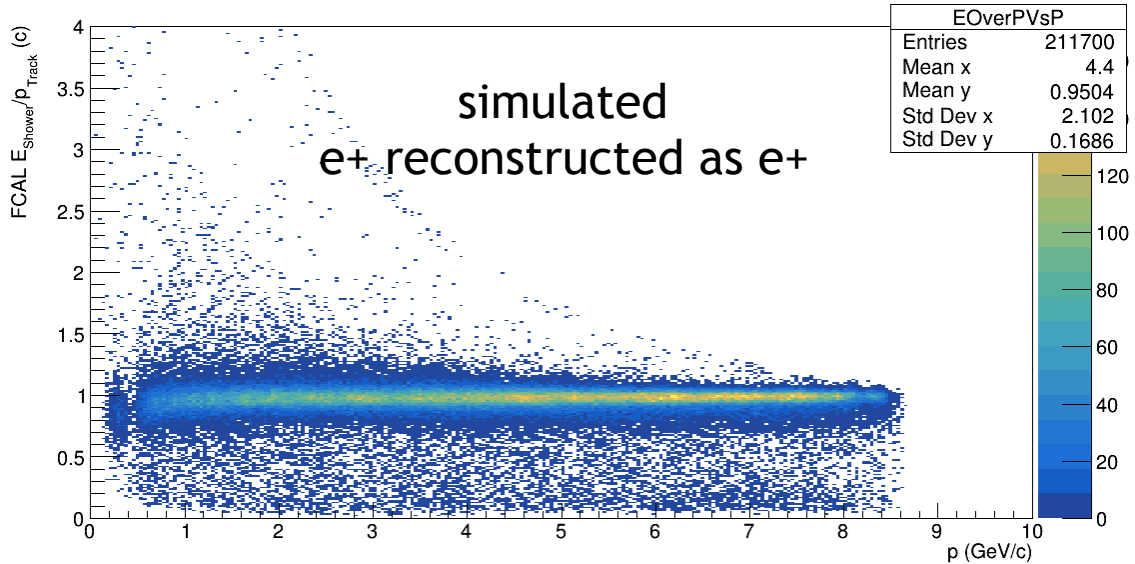

pi+pi- SIMULATED;
BEFORE CUTS

e+ e- SIMULATED;
BEFORE CUTS

e⁺ Candidates

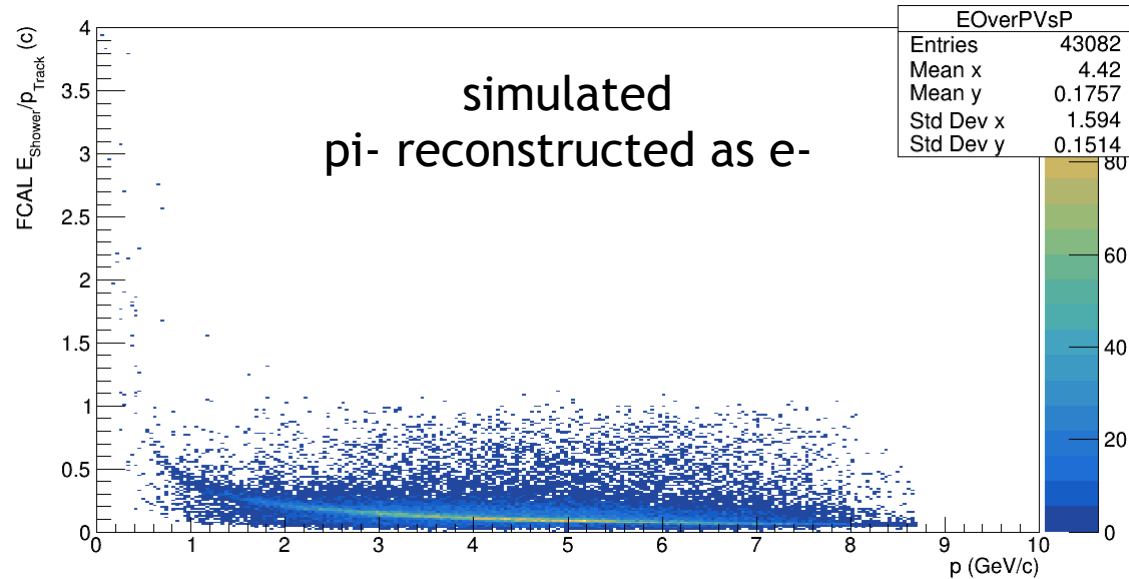

e⁺ Candidates

e⁻ Candidates

e⁻ Candidates

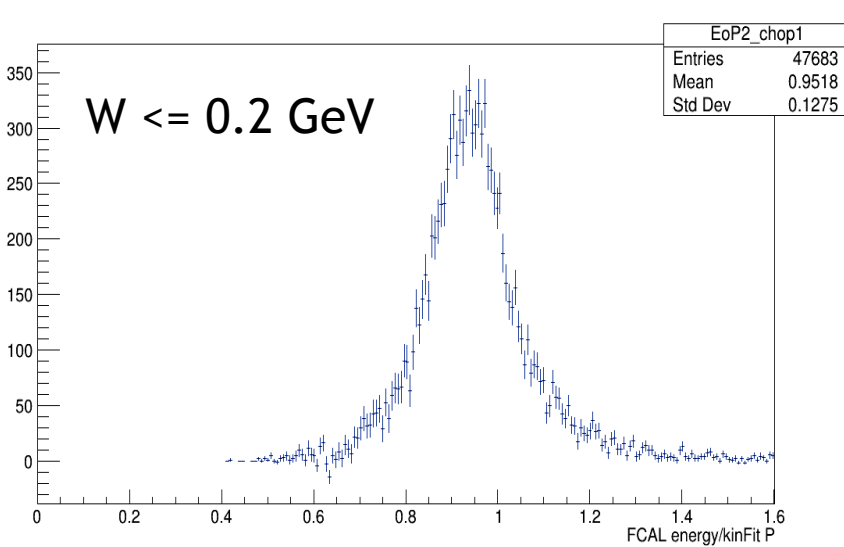

Cuts for $\gamma p \rightarrow e^+ e^- (p)$

Preselection Cuts

1. Default GlueX cuts: https://halldweb.jlab.org/wiki/index.php/Spring_2017_Analysis_Launch_Cuts
2. Require $E/p > 0.7$ for electron and positron tracks in FCAL and BCAL

DSelector Cuts

1. Cut on coherent peak: $8.12 < E_\gamma < 8.88$
2. Require both electron and positron tracks have hit in FCAL
3. Require both electron and positron tracks have hit in TOF
4. Require $d\text{MinKinFitCL} > 10\text{E-}6$
5. Eliminate events with $\text{NumUnusedTracks} \geq 2$, (Split up data into 1 unused and 0 unused.) Today we are only looking at **0 unused track events**.
6. Eliminate events with $\text{Energy_UnusedShowers} > 0$
7. TOF dE/dx cut for electron and positron tracks at 3σ
8. FCAL DOCA cut for e^+ and e^- tracks at 3σ
9. Cut on $\frac{E_1}{p_1}$ and $\frac{E_2}{p_2}$ at $\pm 3\sigma$. Plot $\frac{E_2}{p_2}$ in bins of invariant mass.

Plots of electron FCAL energy/Electron kin fit p in bins of invariant mass
